Heiko Oberdiek’s `makerobust` package defined a command with name \MakeRobustCommand that can be used to make fragile commands robust.

The \LaTeX\ format has, since 2015, included a command \MakeRobust with the same syntax and behaviour. Also by 2019, almost all commands in \LaTeX\ that may be used in a moving argument are already robust.

This package is now just a simple one line package defining the name \MakeRobustCommand as an alias for \MakeRobust, and should not be used in new documents.
