Test of the package **rectopma**
and suggestions for its use
(I need a long title)*

B.Benciolini†      No Second Author‡

1 Introduction

The package **rectopma** makes it possible to reuse the main content of `\title` and
`\author` in different parts of a document. It is also possible to force linebreaks
in the title with a command that is only active inside the top-matter, not when
the title is re-printed elsewhere.

2 Instruction

The new commands `\intitlebreak` and `\intitlebreakvspath` (vs= vertical skip)
are used to force a line break in the title that disappears when the title itself
is re-used outside the top matter of the paper. The content of `\title` and
`\author` must be saved with the command `\SaveTopMatter` before the action
of `\maketitle` and can be reprinted with the new commands `\SavedAuthor`
and `\SavedTitle`. When they are reprinted the names of the various authors
are simply separated by commas and the content of `\thanks` is ignored.

3 Examples

The authors of this paper are listed here after: B.Benciolini, No Second Author.
This is obtained with `\SavedAuthor`. It is also possible to reprint the title, by
means of `\SavedTitle`, and the result is: Test of the package **rectopma** and
suggestions for its use (I need a long title). The title can be printed with a
different style, as in: **Test of the package **rectopma** and suggestions for**
its use (I need a long title), obtained with `\textbf{\SavedTitle}`.
