1 What is PSNFSS?

The PSNFSS collection includes a set of files that provide a complete working setup of the \LaTeX\ font selection scheme (NFSS2) for use with common PostScript fonts. It covers the so-called ‘Base 35’ fonts (which are built into any Level 2 PostScript printing device and the Ghostscript interpreter) and a number of free fonts.

2 Package overview

The easiest way to make use of the above-mentioned typefaces is to completely replace one or more of the font families used by \LaTeX\ as ‘roman’, ‘sans serif’ and ‘typewriter’ family and for math. This is accomplished by the packages listed in table 1. Its first row lists the default (Computer Modern) font families. An empty column indicates that a package does not change the particular font family. Some of these packages need more detailed explanation and are described in the below sections 4, 5 and 6.

The PSNFSS distribution includes also a package pifont, which serves for accessing symbol fonts (aka ‘Pi fonts’), such as Symbol and Zapf Dingbats, see section 7.

3 Special considerations

3.1 Output font encoding

None of the packages listed in table 1 changes the output font encoding from its default setting OT1. It is, however, highly recommended to use the fonts with the extended T1 and TS1 (text symbols) encodings by means of the commands:
Table 1: Packages for using common PostScript fonts

</tbody>
</table>

\usepackage[T1]{fontenc}
\usepackage{textcomp}

When using PostScript fonts that come from ‘outside the \TeX world’, there is no reason at all to stay with the obsolete OT1 encoding, which would not provide access to all available glyphs. However, since these fonts were not particularly designed for use with \TeX, they do not include all of the text companion (TS1) symbols.

3.2 Euro support

From PSNFSS version 9.1 on, all supported text font families, with the exception of put (Utopia), provide a built-in Euro symbol \texteuro. Using this command requires the textcomp package; see above.

3.3 Inter-line spacing

With certain font families, the leading of the standard LaTeX document classes may be too small. This results from the larger x-height of these typefaces, as compared with Computer Modern. Since it is a question of document design and line width, the packages of the PSNFSS bundle do not take care of this. Issuing the command

\linespread{⟨factor⟩}

in the preamble will globally enlarge the leading by the given factor. Typical values for ⟨factor⟩ are in the range of 1.04...1.1.
3.4 Using sans serif fonts

The packages `helvet` and `avant` do not change the default text font family from ‘roman’. If required, the additional command

\renewcommand{\familydefault}{\sfdefault}

makes LaTeX use the sans serif font family (Helvetica or Avant Garde) as the default one in text mode. Notice, however, that this does not change the fonts used in the formulas!

4 The package helvet

Helvetica is actually somewhat larger than other typefaces of the same nominal size. As a result, mixing, e.g., Times and Helvetica within running text may look bad.

\[\text{scaled}=(\text{scale})\]
\[\text{scaled}\]

This can be fixed by loading the package with the option \[\text{scaled}=(\text{scale})\], for instance: \usepackage[scaled=.92]{helvet}. As a result, the font family \text{phv} (Helvetica) will be scaled down to 92% of its ‘natural’ size, which is suitable for use with Adobe Times. Specifying \[\text{scaled}\] alone is equivalent to \[\text{scaled}=0.95\].

5 The package mathpazo

Loading this package changes the default roman font family to Adobe Palatino, and the virtual ’mathpazo’ fonts will be used for math. These virtual fonts are made up basically from Palatino Italic, with the missing math symbols coming from the CM and Pazo math fonts.

5.1 Package options

\[\text{sc}\]
\[\text{osf}\]

By default, the package mathpazo uses the typeface family \text{ppl} as the roman text font family. The option \[\text{sc}\] selects Palatino with real smallcaps (family \text{pplx})
insread. Correspondingly, the option [osf] selects Palatino with smallcaps and default oldstyle figures (family pplj). Of course, oldstyle figures will be used only in text mode, as opposed to formulas. Using either option is strongly recommended: Beside the real smallcaps, the font families pplx and pplj show further improvements over ppl: Increased word space, enhanced kerning tables, additional ‘dotlessj’ glyph.

[slantedGreek]

When the package is loaded with the [slantedGreek] option, uppercase Greek letters in math will be italic by default.

[noBBpl]

This option disables the use of the Pazo fonts as a partial \mathbb alphabet – see below. The option should be specified, if you want to use a different ‘blackboard bold’ font.

5.2 New commands

\upGamma, \upDelta...\upOmega

Regardless of the slantedGreek option, these commands always yield upright uppercase Greek letters. Upright lowercase Greek is, however, not available.

\mathbold
\mathbb

\mathbold is a math alphabet for typesetting variables (incl. Greek) in a bold italic style. Do not mix this up with \mathbf, which selects a bold upright text font for use in math!

\mathbb is a ‘blackboard bold’ alphabet, whose characters are taken from the Pazo fonts. All upper case letters and the numeral ‘1’ are available. If you want to use a different, external, doublestroke alphabet, load the package mathpazo with the package option [noBBppl], see above.

New feature 2004-09-15 v9.2
5.3 Font size of the ‘large’ math symbols

With \texttt{mathpazo}, the ‘large’ math symbols are automatically scaled to fit the base font size. In contrast to standard \LaTeX\ you need not load the package \texttt{exscale} for this purpose!

5.4 Known problems

In contrast to the standard \texttt{CM} fonts, the virtual \texttt{mathpazo} fonts do not provide any Greek letters in the math alphabet \texttt{\mathrm}. Applying this math alphabet command to Greek letters will result in garbage output.

6 The package \texttt{mathptmx}

Loading this package changes the default roman font family to Times, and the virtual ‘mathptmx’ fonts will be used for math. These virtual fonts are made up basically from Times Italic, with the missing math symbols coming from CM, RSFS (for \texttt{\mathcal}) and Adobe Symbol.

6.1 Package options

\begin{verbatim}
[slantedGreek]
\end{verbatim}

When the package is loaded with this option, uppercase Greek letters in math will be italic by default.

6.2 New commands

\begin{verbatim}
\upGamma, \upDelta...\upOmega
\end{verbatim}

Regardless of the \texttt{slantedGreek} option, these commands always yield upright uppercase Greek letters. Upright lowercase Greek is, however, not available.

6.3 Font size of the ‘large’ math symbols

With \texttt{mathptmx}, the ‘large’ math symbols are automatically scaled to fit the base font size. In contrast to standard \LaTeX\ you need not load the package \texttt{exscale} for this purpose!
6.4 Known bugs and deficiencies

- There are no bold math fonts, and \texttt{\textbackslash boldmath} has no effect. Use of the package \texttt{bm} in conjunction with \texttt{mathptmx} is not recommended.
- The symbols \texttt{\textbackslash jmath}, \texttt{\textbackslash coprod} and \texttt{\textbackslash amalg} are not available.

7 The package \texttt{pifont}

Using symbol fonts is supported by means of the \texttt{pifont} package, providing commands for using the Zapf Dingbats font, as well as an interface to other families.\textsuperscript{1}

7.1 Commands for using Zapf Dingbats

\[\texttt{\textbackslash ding}\{\langle \texttt{number}\rangle}\]

A given character can be chosen via the \texttt{\textbackslash ding} command. Its parameter is an integer that specifies the character to be typeset. For example, \texttt{\textbackslash ding\{38\}} gives \ding{38}; see table 2 on page 9.

\begin{verbatim}
\begin{dinglist}\{\langle \texttt{number}\rangle\}
\begin{dingautolist}\{\langle \texttt{number}\rangle\}
\texttt{\textbackslash begin\{dinglist\}\{\langle \texttt{number}\rangle\}}
\texttt{\textbackslash begin\{dingautolist\}\{\langle \texttt{number}\rangle\}}

The \texttt{dinglist} environment is a special itemized list. The argument specifies the number of the character to be used as the beginning of each item. For example,
\begin{verbatim}
\begin{dinglist}\{43\}
  \texttt{\textbackslash item The first item in the list}
  \texttt{\textbackslash item The second item in the list}
  \texttt{\textbackslash item The third item in the list}
\end{dinglist}
\end{verbatim}

prints
\begin{verbatim}
  \ding{43}
  The first item in the list
  The second item in the list
  The third item in the list
\end{verbatim}

There also exists an environment \texttt{dingautolist}, which allows you to build an enumerated list with a set of Zapf Dingbats characters. In this case, the argument

\textsuperscript{1}This section was adopted, with minor changes, from [1], 1st ed.
specifies the number of the first character in the list. Subsequent items will be numbered with the character following the previous one. E.g.,

\begin{dingautolist}{192}
\item The first item
\item The second item
\item The third item
\end{dingautolist}

prints

① The first item
② The second item
③ The third item

\dingfill \langle \textit{number} \rangle
\dingline \langle \textit{number} \rangle

\dingfill acts like the other filling commands in \TeX, but fills the space with a chosen symbol « « « « « « « « « « « « « « « « like that.

\dingline generates a freestanding line filled with the given symbol, with a little space on the left and right:

× × × × × × × × × × × × × × × ×

7.2 Generic commands

The \pifont package has a general mechanism for coping with Pi fonts. It provides the following generic commands with, in each case, the first argument \(\langle\textit{family}\rangle\) specifying the name of the Pi font family in question (such as psy for the Symbol font, and pzd for the Zapf Dingbats font, see table 3 on page 11). If indicated, a second argument \(\langle\textit{number}\rangle\) specifies the decimal position of a symbol in that font.

\Pifont \langle\textit{family}\rangle

This switches to the font family \(\langle\textit{family}\rangle\) and the encoding U.

\Pisymbol \langle \textit{family} \rangle \langle \textit{number} \rangle

This command typesets the specified symbol (compare this with the \ding command).

</table>

\begin{Pilist}{⟨family⟩}{⟨number⟩}
\begin{Piautolist}{⟨family⟩}{⟨number⟩}

In the Pilist environment the specified symbol is used in front of each item in an itemized list (compare with the dinglist environment).

Piautolist is an environment where a series of symbols starting with the one at the decimal position ⟨number⟩ in font family ⟨family⟩ is used to number the items in an enumerated list (compare with the dingautolist environment).

\begin{Pifill}{⟨family⟩}{⟨number⟩}
\begin{Piline}{⟨family⟩}{⟨number⟩}

\Pifill acts like the other filling commands in \TeX, but fills the space with a chosen symbol (compare with \dingfill).

\Piline typesets a line consisting of several copies of the specified symbol, with some space at the left and right (compare with \dingline).
8 NFSS classification

Table 3 on the following page lists all text and symbol font shapes supported by the basic PSNFSS distribution, and the related PostScript fonts. With the exception of Charter and Utopia, these fonts are commercial products. Therefore, most \TeX systems include free substitutes instead.

Available encodings are OT1, T1 and TS1, except for Symbol and Zapf Dingbats, which are implemented with encoding U. See [2] for how to access a given font shape directly.

Only the font families \texttt{pplx} and \texttt{pplj} provide true small capitals (and only in the regular series). With the other families the shape ‘sc’ refers to so-called ‘faked’ small capitals, whose typographical quality is – at least – questionable.

The math font families loaded by the \texttt{mathptm}, \texttt{mathptmx}, \texttt{mathpazo} and \texttt{mathppl} packages are not listed here. See the documented source file \texttt{psfonts.dtx} for information on this topic.

9 Obsolete packages

The macro packages listed in table 4 on page 12 should be considered as obsolete. They are provided for compatibility with existing documents only.

9.1 The packages times and palatino

These packages do not load suitable math fonts, and they do not scale the Helvetica fonts appropriately to match Times and Palatino – see section 4. Use \texttt{mathptmx} or \texttt{mathpazo} in conjunction with \texttt{helvet} and \texttt{courier} instead!

In case you need to load Times or Palatino \texttt{without} the related math fonts of the PSNFSS bundle, you can still use the basic NFSS commands. For instance,

\begin{verbatim}
\renewcommand{\rmdefault}{ptm}
\end{verbatim}

changes only the default roman font family to \texttt{ptm}, i.e. Times.

9.2 The package mathptm

The package \texttt{mathptm} is a predecessor to \texttt{mathptmx}. In contrast to the latter and to \LaTeX’s standard behavior, lowercase Greek in math is typeset upright. Zapf Chancery is used as the calligraphic math alphabet, which causes some problems with proper spacing. \texttt{mathptm} needs the font \texttt{cmex9}, which may not be available in Type 1 format.

9.3 The package mathpazo

mathpazo is a predecessor to mathpazo, using also a set of virtual math fonts to go with Palatino. The Greek alphabet is, however, taken from the Euler fonts (which get slanted), rather than from the Pazo fonts. The package mathpazo does not support the Palatino SC/OsF fonts, and there is no ‘blackboard bold’ math alphabet. Further flaws are:

- The spacing within numbers and function names in formulas is somewhat too loose.
- The $\coprod$ symbol is missing.
- There are no bold variants of $\partial$ and $\infty$.
- $jmath$ is taken from the CM math italic font, which does not blend well with Palatino.
- DVI viewers may exhibit problems as to rendering of the artificially slanted Greek letters.

The newer mathpazo package can be considered as superior; yet you may still use mathpazo, if you prefer the shape of its Greek letters.

9.4 The package utopia

Use of the utopia package is no longer recommended, because the newer package fourier provides a basically improved interface to the Utopia typeface and loads suitable math fonts, too. Notice that this package does not belong to the PSNFSS collection!

Furthermore, the $\LaTeX$X3 team does no longer regard the Utopia fonts as a required component of $\LaTeX$, because their license does not comply with the strict guidelines of the FSF.
10 Typeface samples

The following samples show the regular font of each typeface family supported by PSNFSS. The particular font size and baselineskip is indicated below the font name. Notice that Helvetica is scaled to 92% of the nominal size.

Times 10/12pt
The sun was just rising as Dr. Robert entered his wife’s room. An orange glow, and against it the jagged silhouette of the mountains. Then suddenly a dazzling sickle of incandescence between two peaks. The sickle became a half circle and the first long shadows, the first shafts of golden light crossed the garden outside the window. And when one looked up again at the mountains there was the whole unbearable glory of the risen sun.

Palatino 10/12.4pt
The sun was just rising as Dr. Robert entered his wife’s room. An orange glow, and against it the jagged silhouette of the mountains. Then suddenly a dazzling sickle of incandescence between two peaks. The sickle became a half circle and the first long shadows, the first shafts of golden light crossed the garden outside the window. And when one looked up again at the mountains there was the whole unbearable glory of the risen sun.

Bookman 9.6/11.5pt
The sun was just rising as Dr. Robert entered his wife’s room. An orange glow, and against it the jagged silhouette of the mountains. Then suddenly a dazzling sickle of incandescence between two peaks. The sickle became a half circle and the first long shadows, the first shafts of golden light crossed the garden outside the window. And when one looked up again at the mountains there was the whole unbearable glory of the risen sun.

Charter 10/12.4pt
The sun was just rising as Dr. Robert entered his wife’s room. An orange glow, and against it the jagged silhouette of the mountains. Then suddenly a dazzling sickle of incandescence between two peaks. The sickle became a half circle and the first long shadows, the first shafts of golden light crossed the garden outside the window. Don’t use Avant Garde for typesetting larger portions of text!

A monospaced typeface, suitable for typesetting filenames, URLs etc.

To Hermann Zapf – whose strokes are the best.

Credits

The PSNFSS system was originally developed by Sebastian Rahtz.

The virtual mathptm and mathptmx fonts and the related packages were created by Alan Jeffrey, Sebastian Rathz and Ulrik Vieth.

The mathpplxe package and its virtual fonts are based on earlier work by Aloysius Helminck. Special thanks to Daniel Schlieper without whose initiative the package would not have been developed.

The Pazo math fonts and the related virtual fonts were created by Diego Puga.
