Abstract

This article describes the use and the implementation of the \texttt{multicols} environment. This environment allows switching between one and multicolumn format on the same page. Footnotes are handled correctly (for the most part), but will be placed at the bottom of the page and not under each column. \LaTeX{}’s float mechanism, however, is partly disabled in this implementation. At the moment only page-wide floats (i.e., star-forms) can be used within the scope of the environment.

Preface to version 1.8

The 1.8 release improves on the balancing approach. If due to a limited number of break points (e.g., due to large objects) the balanced columns exceed the available vertical space, then balancing is canceled and a normal page is produced first. Some overflow is allowed (controlled by the parameter \texttt{\maxbalancingoverflow} which defaults to 12pt). This ensures that we only cut a normal page if we get enough material carried over to next page.

Also added was support for \texttt{\enlargethispage}. This means it is now possible to request a page to be artificially enlarged or shortened. Note that if you enlarge pages by more than one line you may have to increase the \texttt{collectmore} counter value to ensure that enough material is being picked up.

This command was used on the second page of this manual to shorten it by one line, in order to get rid of a number of widow lines on the following pages.

There are also some small enhancements to the balancing algorithm including a way to require a minimum number of rows in the result.

Finally, version 1.8 adds the command \texttt{\docolaction} to help with more complicated actions that depend on the current column. This command expects 3 arguments: code that is executed if we are in the “first” column, code to execute if we end up in any “middle” column (if there are more than two) and finally code to execute if we are in the “last” column. Thus

\begin{verbatim}
\docolaction{first}{middle}{last}
\end{verbatim}

would typeset a different word depending the type of column this code is executed. Using it like this is probably pointless, but you can imagine applications like writing something into the nearest margin, etc.

As this feature needs at least two \LaTeX{} runs to produce correct results and as it adds to the processing complexity it is only made available if one add the option \texttt{colaction} when loading the package.

\footnote{This file has version number v1.8w, last revised 2019/03/01.}

\footnote{Note: This package is released under terms which affect its use in commercial applications. Please see the details at the top of the source file.}
Preface to version 1.7 (right to left support)

The 1.7 release adds support for languages that are typeset right-to-left. For those languages the order of the columns on the page also need to be reversed—something that wasn’t supported before. The next paragraph demonstrates the result (as it is typeset as if we are writing in a left-to-right language—so read the rightmost column first). The change is initialized via \RLmulticolcolumns and returning to left-right (default) is done via \LRmulticolcolumns.

Right-to-left typesetting will only reverse the column orders. Any other support needed will have to be provided by other means, e.g., using appropriate fonts and reversing the writing directions within the columns. As footnotes are typeset in full measure the footnote rule needs to be redefined as if they are below a single column, i.e., using \textwidth not \columnwidth.

For example:
\renewcommand \footnoterule{\%\kern-3pt\hbox to\textwidth\hskip .6\textwidth\hrulefill \kern2.6pt}  

Preface to version 1.5 + 1.6

The 1.5 release contains two major changes: multicols will now support up to 10 columns and two more tuning possibilities have been added to the balancing routine. The balancing routine now checks the badness of the resulting columns and rejects solutions that are larger than a certain threshold. At the same time multicols has been upgraded to run under \LaTeX{}2ε.

Later changes to 1.5 include \columnbreak and \multicols*.

For version 1.6 micro-spacing around the boxes produced by multicols has been improved to allow for baseline-grid typesetting.

1 Introduction

Switching between two-column and one-column layout is possible in \LaTeX{}, but every use of \texttt{\twocolumn} or \texttt{\onecolumn} starts a new page. Moreover, the last page of two-column output isn’t balanced and this often results in an empty, or nearly empty, right column. When I started to write macros for \texttt{doc.sty} (see “The doc-Option”, \textit{TUGboat} volume 10 #2, pp. 245–273) I thought that it would be nice to place the index on the same page as the bibliography. And balancing the last page would not only look better, it also would save space; provided of course that it is also possible to start the next article on the same page. Rewriting the index environment was comparatively easy, but the next goal, designing an environment which takes care of footnotes, floats, etc., was a harder task. It took me a whole weekend\textsuperscript{1} to get together the few lines of code below and there is still a good chance that I missed something after all.

Try it and, hopefully, enjoy it; and please direct bug reports and suggestions back to Mainz.

2 The User Interface

To use the environment one simply says
\begin{multicols}{⟨number⟩} 
⟨multicolumn text⟩ 
\end{multicols}  

where ⟨number⟩ is the required number of columns and ⟨multicolumn text⟩ may contain arbitrary \LaTeX{} commands, except that floats and marginpars are not allowed in the current implementation\textsuperscript{2}.

As its first action, the \multicols{} environment measures the current page to determine whether there is enough room for some

\textsuperscript{1}I started with the algorithm given in the \TeX{}book on page 417. Without this help a weekend would not have been enough. (This remark was made in the documentation of the initial release, since then several hundreds more hours went into improving the original code.)

\textsuperscript{2}This is dictated by lack of time. To implement floats one has to reimplement the whole \LaTeX{} output routine.
When the end of the \texttt{multicols} environment is encountered, an analogous mechanism is employed, but now we test whether there is a space larger than \texttt{postmulticols} available. Again we add \texttt{multicolsep} or start a new page.

It is often convenient to spread some text over all columns, just before the multicolumn output, without any page break in between. To achieve this the \texttt{multicols} environment has an optional second argument which can be used for this purpose. For example, the text you are now reading was started with

\begin{verbatim}
\begin{multicols}{3}
[\section{The User Interface}] ...
\end{verbatim}

If such text is unusually long (or short) the value of \texttt{premulticols} might need adjusting to prevent a bad page break. We therefore provide a third argument which can be used to overwrite the default value of \texttt{premulticols} just for this occasion. So if you want to combine some longer single column text with a multicols environment you could write

\begin{verbatim}
\begin{multicols}{3}
[\section{Index}]
This index contains ...
[6cm]
...
\end{verbatim}

The space between columns is controlled by the length parameter \texttt{columnsep}. The width for the individual columns is automatically calculated from this parameter and the current \texttt{linewidth}. In this article a value of 18.0pt was used.

Separation of columns with vertical rules is achieved by setting the parameter \texttt{columnseprule} to some positive value. In this article a value of .4pt was used.

The color of the rules separating the columns can be specified through \texttt{columnseprulecolor}. The default value is \texttt{normalcolor}.

Since narrow columns tend to need adjustments in interline spacing we also provide a \texttt{(skip)} parameter called \texttt{multicolbaselineskip} which is added to the \texttt{baselineskip} parameter inside the \texttt{multicols} environment. Please use this parameter with care or leave it alone; it is intended only for package file designers since even small changes might produce totally unexpected changes to your document.

2.1 Balancing columns

Besides the previously mentioned parameters, some others are provided to influence the layout of the columns generated.

Paragraphing in \TeX{} is controlled by several parameters. One of the most important is called \texttt{tolerance}: this controls the allowed ‘looseness’ (i.e. the amount of blank space between words). Its default value is 200 (the \LaTeX{} \texttt{fussy}) which is too small for narrow columns. On the other hand the \texttt{sloppy} declaration (which sets \texttt{tolerance} to 10000 = \texttt{∞}) is too large, allowing really bad spacing.\footnote{Look at the next paragraph, it was set with the \texttt{sloppy} declaration.}

We therefore use a \texttt{multicoltolerance} parameter for the \texttt{tolerance} value inside the \texttt{multicol} environment. Its default value is 9999 which is less than infinity but ‘bad’ enough for most paragraphs in a multicolumn environment. Changing its value should be done outside the \texttt{multicol} environment. Since \texttt{tolerance} is set to \texttt{multicoltolerance} at the beginning of every \texttt{multicol} environment one can locally overwrite this default by assigning \texttt{tolerance=_x\langle desired value\rangle}. There also exists a \texttt{multicolpretolerance} parameter holding the value for \texttt{pretolerance} within a \texttt{multicol} environment. Both parameters are usually used only by package designers.

Generation of multicolumn output can be divided into two parts. In the first part we are collecting material for a page, shipping it out, collecting material for the next page, and so on. As a second step, balancing will be done when the end of the \texttt{multicol} environment is reached. In the first step \TeX{} might consider more material whilst finding the final column content than it actually uses when shipping out the page. This might cause a problem if a footnote is encountered in the part of the input considered, but not used, on the current page. In this case the footnote might show up on the current page, while the footnotemark corresponding to this footnote

\footnote{Actually the added space may be less because we use \texttt{addvspace} (see the \LaTeX{} manual for further information about this command).}
might be set on the next one.\footnote{The reason behind this behavior is the asynchronous character of the \TeX \texttt{p}age\_\texttt{builder}. However, this could be avoided by defining very complicated output routines which don’t use \TeX primitives like \texttt{\textbackslash insert} but do everything by hand. This is clearly beyond the scope of a weekend problem.}
Therefore the \texttt{multicols} environment gives a warning message\footnote{This message will be generated even if there are no footnotes in this part of the text.} whenever it is unable to use all the material considered so far.

If you don’t use footnotes too often the chances of something actually going wrong are very slim, but if this happens you can help \TeX by using a \texttt{\pagebreak} command in the final document.

Another way to influence the behavior of \TeX in this respect is given by the counter variable ‘collectmore’. If you use the \texttt{\setcounter} declaration to set this counter to \texttt{⟨number⟩}, \TeX will consider \texttt{⟨number⟩} more (or less) lines before making its final decision. So a value of \texttt{-1} may solve all your problems at the cost of slightly less optimal columns.

In the second step (balancing columns) we have other bells and whistles. First of all you can say \texttt{\textbackslash raggedcolumns} if you don’t want the bottom lines to be aligned. The default is \texttt{\textbackslash flushcolumns}, so \TeX will normally try to make both the top and bottom baselines of all columns align.

If there is only a small amount of material available for balancing then you may end up with very few lines per column. In an extreme case there may be only one line which looks distinctly odd. In that case it might be better to have more material distributed to the earlier columns even if that means that later columns are empty or partially empty. This is controlled through the counter ‘minrows’ (default 1).

If set to a higher value then the balancing will have at least that many rows in the first column (and also all further columns until it runs out of material).

Additionally you can set another counter, the ‘unbalance’ counter, to some positive \texttt{⟨number⟩}. This will make all but the right-most column \texttt{⟨number⟩} of lines longer than they would normally have been. ‘Lines’ in this context refer to normal text lines (i.e. one \texttt{\baselineskip} apart): thus, if your columns contain displays, for example, you may need a higher \texttt{⟨number⟩} to shift something from one column into another. A negative value can make sense if you have \texttt{minrows} and want to locally adjust that.

Unlike ‘collectmore’, the ‘unbalance’ counter is reset to zero at the end of the environment so it only applies to one \texttt{multicols} environment.

The two methods may be combined but I suggest using these features only when fine tuning important publications.

Two more general tuning possibilities were added with version 1.5. \TeX allows to measure the badness of a column in terms of an integer value, where 0 means optimal and any higher value means a certain amount of extra white space. 10000 is considered to be infinitely bad (\TeX does not distinguish any further). In addition the special value 100000 means overfull (i.e., the column contains more text than could possibly fit into it).

The new release now measures every generated column and ignores solutions where at least one column has a badness being larger than the value of the counter \texttt{columnbadness}. The default value for this counter is 10000, thus \TeX will accept all solutions except those being overfull. By setting the counter to a smaller value you can force the algorithm to search for solutions that do not have columns with a lot of white space.

However, if the setting is too low, the algorithm may not find any acceptable solution at all and will then finally choose the extreme solution of placing all text into the first column.

Often, when columns are balanced, it is impossible to find a solution that distributes the text evenly over all columns. If that is the case the last column usually has less text than the others. In the earlier releases this text was stretched to produce a column with the same height as all others, sometimes resulting in really ugly looking columns.

In the new release this stretching is only done if the badness of the final column is not larger than the value of the counter \texttt{finalcolumnbadness}. The default setting is 9999, thus preventing the stretching for all columns that \TeX would consider infinitely bad. In that case the final column is allowed to run short which gives a much better result.

And there are two more parameters of some experimental nature, one called \texttt{\textbackslash multicolovershoot} the other \texttt{\textbackslash multicolundershoot}. They control the amount of space a column within the \texttt{multicols} environment is allowed to be “too full” or “too short” without affecting the column badness. They are set to 0pt and 2pt, respectively.

Finally, when doing the balancing at the end, columns may become higher than the remaining available space. In that case the algorithm aborts and instead generates a normal page. How-
ever, if the amount is not too large, e.g., a line or so, then it might be better to keep everything on the same page instead of starting a new page with just one line after balancing. So the parameter \texttt{\maxbalancingoverflow} governs this process: only when the excess gets larger than its value balancing is aborted.

2.2 Not balancing the columns

Although this package was written to solve the problem of balancing columns, I got repeated requests to provide a version where all white space is automatically placed in the last column or columns. Since version v1.5q this now exists: if you use \texttt{multicols*} instead of the usual environment the columns on the last page are not balanced. Of course, this environment only works on top-level, e.g., inside a box one has to balance to determine a column height in absence of a fixed value.

2.3 Manually breaking columns

Another request often voiced was: “How do I tell \LaTeX{} that it should break the first column after this particular line?”. The \texttt{\pagebreak} command (which works with the two-column option of \LaTeX) is of no use here since it would end the collection phase of \texttt{multicols} and thus all columns on that page. So with version 1.5u the \texttt{\columnbreak} command was added. If used within a paragraph it marks the end of the current line as the desired breakpoint. You can observe its effect on the previous page where three lines of text have been artificially forced into the second column (resulting in some white space between paragraphs in the first column).

2.4 Floats inside a \texttt{multicols} environment

Within the \texttt{multicols} environment the usual star float commands are available but their function is somewhat different as in the two-column mode of standard \LaTeX. Stared floats, e.g., \texttt{figure*}, denote page wide floats that are handled in a similar fashion as normal floats outside the \texttt{multicols} environment. However, they will never show up on the page where they are encountered. In other words, one can influence their placement by specifying a combination of \texttt{t}, \texttt{b}, and/or \texttt{p} in their optional argument, but \texttt{h} doesn’t work because the first possible place is the top of the next page. One should also note, that this means that their placement behavior is determined by the values of \texttt{topfraction}, \texttt{这位} rather than by \texttt{dbl}.....

2.5 Support for right-to-left typesetting

In right-to-left typesetting the order of the columns on the page also need to be reversed, i.e., the first column has to appear on the far right and the last column on the left. This is supported through the commands \texttt{\Rmulticolcolumns} (switching to right-to-left typesetting) and \texttt{\Lmulticolcolumns} (switching to left-to-right typesetting) the latter being the default.

2.6 Warnings

Under certain circumstances the use of the \texttt{multicols} environment may result in some warnings from \TeX{} or \LaTeX. Here is a list of the important ones and the possible cause:

Underfull \texttt{\hbox} (badness ...)

As the columns are often very narrow \TeX{} wasn’t able to find a good way to break the paragraph. Underfull denotes a loose line but as long as the badness value is below 10000 the result is probably acceptable.

Underfull \texttt{\vbox} ... while \texttt{\output} is active

If a column contains a character with an unusual depth, for example a ‘,’ in the bottom line then this message may show up. It usually has no significance as long as the value is not more than a few points.

\LaTeX{} Warning: I moved some lines to the next page

As mentioned above, \texttt{multicols} sometimes screws up the footnote numbering. As a precaution, whenever there is a footnote on a page where \texttt{multicols} had to leave a remainder for the following page this warning appears. Check the footnote numbering on this page. If it turns out that it is wrong, you have to manually break the page using \texttt{\newpage} or \texttt{\pagebreak}...

Floats and marginpars not allowed inside \texttt{multicols'} environment!

This message appears if you try to use the \texttt{\marginpar} command or an unstarred version of the \texttt{figure} or \texttt{table} environment. Such floats will disappear!

Very deep columns! Grid alignment might be broken

This message can only appear if the option \texttt{grid} was chosen. In that case it will show up if a column has a very large depth so that \texttt{multicols} is unable to back up to its baseline. This is only relevant if one tries to produce
a document where all text lines are aligned at an invisible grid, something that requires careful adjustment of many parameters and macros, e.g., heading definitions.

2.7 Tracing the output

To understand the reasoning behind the decisions \TeX makes when processing a \texttt{multicol}s environment, a tracing mechanism is provided. If you set the counter ‘\texttt{tracingmulticols}’ to a positive \langle \texttt{number} \rangle you then will get some tracing information on the terminal and in the transcript file:

\langle \texttt{number} \rangle = 1. \TeX will now tell you, whenever it enters or leaves a \texttt{multicol}s environment, the number of columns it is working on and its decision about starting a new page before or after the environment.

\langle \texttt{number} \rangle = 2. In this case you also get information from the balancing routine: the heights tried for the left and right-most columns, information about shrinking if the \texttt{raggedcolumns} declaration is in force and the value of the ‘unbalance’ counter if positive.

\langle \texttt{number} \rangle = 3. Setting \langle \texttt{number} \rangle to this value will additionally trace the mark handling algorithm. It will show what marks are found, what marks are considered, etc. To fully understand this information you will probably have to read carefully through the implementation.

\langle \texttt{number} \rangle \geq 4. Setting \langle \texttt{number} \rangle to such a high value will additionally place an \texttt{hrule} into your output, separating the part of text which had already been considered on the previous page from the rest. Clearly this setting should not be used for the final output. It will also activate even more debugging code for mark handling.

3 Prefaces to older versions

3.1 Preface to version 1.4

Beside fixing some bugs as mentioned in the \texttt{multicol}.\texttt{bug} file this new release enhances the \texttt{multicol}s environment by allowing for balancing in arbitrary contexts. It is now, for example, possible to balance text within a \texttt{multicol}s or a \texttt{minipage} as shown in 2 where a \texttt{multicol}s environment within a \texttt{quote} environment was used. It is now even possible to nest \texttt{multicol}s environments.

The only restriction to such inner \texttt{multicol}s environments (nested, or within \TeX’s internal vertical mode) is that such variants will produce a box with the balanced material in it, so that they can not be broken across pages or columns.

Additionally I rewrote the algorithm for balancing so that it will now produce slightly better results.

I updated the source documentation but like to apologize in advance for some ‘left over’ parts that slipped through the revision.

A note to people who like to improve the balancing algorithm of \texttt{multicol}s: The balancing routine is now placed into a single macro which is called \texttt{/balance@columns}. This means that one can easily try different balancing routines by rewriting this macro. The interface for it is explained in table 1. There are several improvements possible, one can think of integrating the \texttt{badness} function of \TeX\texttt{3}, define a faster algorithm for finding the right column height, etc. If somebody thinks he/she has an enhancement I would be pleased to learn about it. But please obey the copyright notice and don’t change \texttt{multicol.dtx} directly!

3.2 Preface to version 1.2

After the article about the \texttt{multicol}s environment was published in \texttt{TUGboat} 10#3, I got numerous requests for these macros. However, I also got a changed version of my style file, together with a letter asking me if I would include the changes to get better paragraphing results in the case of narrow lines. The main differences to my original style option were additional parameters (like \texttt{multicoladjdemerits} to be used for \texttt{adjdemerits}, etc.) which would influence the line breaking algorithm.

But actually resetting such parameters to zero or even worse to a negative value won’t give better line breaks inside the \texttt{multicol}s environment. \TeX’s line breaking algorithm will only look at those possible line breaks which can be reached without a badness higher than the current value of \texttt{tolerance} (or \texttt{pretolerance} in the first pass). If this isn’t pos-
The macro \balance@columns that contains the code for balancing gathered material is a macro without parameters. It assumes that the material for balancing is stored in the box \mult@box which is a \vbox. It also "knows" about all parameters set up by the \multicols environment, like \col@number, etc. It can also assume that \@colroom is the still available space on the current page.

When it finishes it must return the individual columns in boxes suitable for further processing with \page@sofar. This means that the left column should be stored in box register \mult@gfirstbox, the next in register \mult@firstbox + 2, ..., only the last one as an exception in register \mult@grightbox. Furthermore it has to set up the two macros \kept@firstmark and \kept@botmark to hold the values for the first and bottom mark as found in the individual columns. There are some helper functions defined in section 5.1 which may be used for this. Getting the marks right "by hand" is non-trivial and it may pay off to first take a look at the documentation and implementation of \balance@columns below before trying anew.

Table 1: Interface description for \balance@columns

Table below is nearly unchanged, I only added documentation at places where new code was added.

4 The Implementation

We are now switching to two-column output to show the abilities of this environment (and bad layout decisions).

4.1 The documentation driver file

The next bit of code contains the documentation driver file for \TeX, i.e., the file that will produce the documentation you are currently reading. It will be extracted from this file by the docstrip program. Since this is the first code in this file one can produce the documentation simply by running \TeX on the .dtx file.

```
1 (*driver)
2 \documentclass{ltxdoc}
```

We use the balancingshow option when loading \multicols so that full tracing is produced. This has to be done before the \doc package is loaded, since \doc
\setemergencystretch: This is a hook for people who like to play around. It is supposed to set the emergencystretch \emdimen register provided in the new \TeX~3.0. The first argument is the number of columns and the second one is the current \hsize. At the moment the default definition is 4pt \times \#1, i.e. the \hsize isn’t used at all. But maybe there are better formulae.
\set@floatcmds: This is the hook for the experts who like to implement a full float mechanism for the multicols environment. The \@ in the name should signal that this might not be easy.

Table 2: The new commands of \texttt{multicol.sty} version 1.2. Both commands might be removed if good solutions to these open problems are found. I hope that these commands will prevent that nearly identical style files derived from this one are floating around.

17 \setcounter{columnbadness}{7000}
18 \setcounter{finalcolumnbadness}{7000}

The index is supposed to come out in four columns. And we don’t show macro names in the margin.

5 otherwise requires \texttt{multicol} without any options.
3 \usepackage{multicol}[1999/05/25]
4 \usepackage{doc}

First we set up the page layout suitable for this article.
6 \setlength{\textwidth}{39pc}
7 \setlength{\textheight}{54pc}
8 \setlength{\parindent}{1em}
9 \setlength{\parskip}{0pt plus 1pt}
10 \setlength{\oddsidemargin}{0pc}
11 \setlength{\marginparwidth}{0pc}
12 \setlength{\topmargin}{-2.5pc}
13 \setlength{\headsep}{20pt}
14 \setlength{\columnsep}{1.5pc}

We want a rule between columns.
15 \setlength\columnseprule{.4pt}

We also want to ensure that a new \texttt{multicols} environment finds enough space at the bottom of the page.
16 \setlength{\premulticols}{6\baselineskip}

When balancing columns we disregard solutions that are too bad. Also, if the last column is too bad we typeset it without stretch.

\begin{document}
\typeout{****************************************
\texlabel{* Expect some Under- and overfull boxes.
\textfamilydefault{\hlc{\setdefaultfamily{\rmfamily}}}}
\DocInput{multicol.dtx}
\end{document}

4.2 Identification and option processing

We start by identifying the package. Since it makes use of features only available in \LaTeX\ 2ε we ensure that this format is available. (Now this is done earlier in the file.)

\begin{verbatim}
38 \{\*package
39 % \NeedsTeXFormat{LaTeX2e}
40 % \ProvidesPackage{multicol}[....]/...
41 % v... multicolumn formatting]
\end{verbatim}

Next we declare options supported by \texttt{multicols}. Two-column mode and \texttt{multicols} do not work together so we warn about possible problems. However, since you can revert to \texttt{onecolumn} in which case \texttt{multicols} does work, we don’t make this an error.

\begin{verbatim}
42 \DeclareOption{twocolumn}
43 {\PackageWarning{multicol}{May not work
44 with the twocolumn option}}
\end{verbatim}

Tracing is done using a counter. However it is also possible to invoke the tracing using the options declared below.

\begin{verbatim}
45 \newcount@tracingmulticols
46 \DeclareOption{errorshow}
47 {\@[tracingmulticols]\texttt{z\#}}
48 \DeclareOption{infoshow}
49 {\@[tracingmulticols]\texttt{\@e}}
50 \DeclareOption{balancingshow}
51 {\@[tracingmulticols]\texttt{tw\@}}
52 \DeclareOption{markshow}
53 {\@[tracingmulticols]\texttt{thr\@}}
\end{verbatim}
The next option is intended for typesetting on a \baselineskip grid. Right now it doesn’t do anything other than warning if it thinks that the grid got lost.

Next option enables the \docolaction command. As this changes the \aux file content this is not automatically enabled.

4.3 Starting and Ending the multicols Environment

As mentioned before, the multicols environment has one mandatory argument (the number of columns) and up to two optional ones. We start by reading the number of columns into the \colnumber register.

If the user forgot the argument, \TeX will complain about a missing number at this point. The error recovery mechanism will then use zero, which isn’t a good choice in this case. So we should now test whether everything is okay. The minimum is two columns at the moment.

Within the environment we need a special version of the kernel \@footnotetext command since the original sets the \hsize to \columnwidth which is not correct in the multicols environment. Here \columnwidth refers to the width of the individual column and the footnote should be in \textwidth. Since \footnotetext has a different definition inside a minipage environment we do not redefine it directly. Instead we locally set \columnwidth to \textwidth and call the original (current) definition stored in \orig@footnotetext. If the multicols environment is nested inside another multicols environment then the redefinition has already happened. So be better test for this situation. Otherwise, we will get a \TeX stack overflow as this would generate a self-referencing definition.

Now we can safely look for the optional arguments.

The \multcols macro grabs the first optional argument (if any) and looks for the second one.

This argument should be a \⟨ dimen ⟩ denoting the minimum free space needed on the current page to start the environment. If the user didn’t supply one, we use \premulticols as a default.

After removing all arguments from the input we are able to start with \multcols. First thing we do is to decide whether or not this is an unbounded multicols environment, i.e., one that may split across pages, or one that has to be typeset into a box. If we are in \TeX’s “inner” mode (e.g., inside a box already) then we have a boxed version of multicols therefore we set the \boxedmulticols
switch to true. The \texttt{multicols} should start in vertical mode. If we are not already there we now force it with \texttt{\par} since otherwise the test for “inner” mode wouldn’t show if we are in a box.

\par
\ifinner \@boxedmulticolstrue

Otherwise we check \texttt{\doublecol@number}. This counter is zero outside a multicols environment but positive inside (this happens a little later on). In the second case we need to process the current multicols also in “boxed mode” and so change the switch accordingly.

\else \ifnum \doublecol@number\texttt{\@m}\@boxedmulticolstrue

Then we look to see if statistics are requested:

\mult@info\texttt{\@m}
\{Starting environment with \texttt{\the\col@number} space columns\%

In boxed mode we add some more info.

\if@boxedmulticols \MessageBreak (boxed mode)\fi

Then we measure the current page to see whether a useful portion of the multicolumn environment can be typeset. This routine might start a new page.

\enough@room\texttt{\@m}

Now we output the first argument and produce vertical space above the columns. (Note that this argument corresponds to the first optional argument of the \texttt{multicols} environment.) For many releases this argument was typeset in a group to get a similar effect as \texttt{\twocolumn[..]} where the argument is also implicitly surrounded by braces. However, this conflicts with local changes done by things like sectioning commands (which account for the majority of commands used in that argument) messing up vertical spacing etc. later in the document so that from version v1.5q on this argument is again typeset at the outer level.

#1\par\addvspace\multicolsep

When the last line of a paragraph had a positive depth then this depth normally taken into account by the \texttt{baselineskip} calculation for the next line. However, the columns produced by a following \texttt{multicol} are rigid and thus the distance from the baseline of a previous text line to the first line in a \texttt{multicol} would differ depending on the depth of the previous line. To account for this we add a negative space unless the depth is \texttt{-1000pt} which signals something special to \texttt{\TeX} and is not supposed to be a real depth.

\ifdim \prevdepth = \texttt{-\@m}\@p@ \else

The actual generation of this corrective space is a little bit more complicated as it doesn’t make sense to always back up to the previous baseline (in case an object with a very large depth was placed there, e.g., a centered tabular). So we only back up to the extend that we are within the \texttt{baselineskip} grid. We know that the box produced by \texttt{multicols} has \texttt{\topskip} at its top so that also needs to be taken into account.

\@tempcnta \prevdepth
\@tempcntb \baselineskip
\divide \@tempcnta \@tempcntb
\advance \@tempcnta \@ne
\dimen@ \prevdepth
\advance \dimen@ -\@tempcnta \baselineskip
\advance \dimen@ \topskip
\kern -\dimen@

We start a new grouping level to hide all subsequent changes (done in \texttt{\prepare@multicols} for example).

\begingroup
\prepare@multicols

If we are in boxed mode we now open a box to typeset all material from the multicols body into it, otherwise we simply go ahead.

\if@boxedmulticols
\setbox \mult@box \vbox \bgroup
\color@setgroup

We may have to reset some parameters at this point, perhaps \texttt{\@parboxrestore} would be the right action but I leave it for the moment.

\fi

We finish by suppressing initial spaces.

\ignorespaces}

Here is the switch and the box for “boxed” \texttt{multicols} code.

\newif \ifboxedmulticols
\boxedmulticolsfalse
\newbox \mult@box

The \texttt{\enough@room} macro used above isn’t perfect but works reasonably well in this context. We measure the free space on the current page by subtracting \texttt{\pagetotal} from \texttt{\pagegoal}. This isn’t entirely correct since it doesn’t take the ‘shrinking’ (i.e. \texttt{\pageshrink}) into account. The ‘recent contribution list’ might be nonempty so we start with
\par and an explicit \penalty.\footnote{See the documentation of \endmulticols for further details.} Actually, we use \addpenalty to ensure that a following \addvspace will ‘see’ the vertical space that might be present. The use of addpenalty will have the effect that all items from the recent contributions will be moved to the main vertical list and the \pagetotal value will be updated correctly. However, the penalty will be placed in front of any dangling glue item with the result that the main vertical list may already be overfull even if \TeX{} is not invoking the output routine.

135 \def\enough@room#1{\%
Measuring makes only sense when we are not in “boxed mode” so the routine does nothing if the switch is true.
136 \iffalse\def\enough@room#1{\else\par
137 \fi\%}

To empty the contribution list the first release contained a penalty zero but this had the result that \addvspace couldn’t detect preceding glue. So this was changed to \addpenalty. But this turned out to be not enough as \addpenalty will not add a penalty when @nobreak is true. Therefore we force this switch locally to false. As a result there may be a break between preceding text and the start of a multicols environment, but this seems acceptable since there is the optional argument for exactly this reason.

138 \bgroup\@nobreakfalse\addpenalty\z@\egroup
139 \page@free \pagegoal\parshape\z@
140 \advance \page@free -\pagetotal

To be able to output the value we need to assign it to a register first since it might be a register (default) in which case we need to use \the or it might be a plain value in which case \the would be wrong.

141 \@tempskipa#1\relax

Now we test whether tracing information is required:

142 \mult@info\z@
143 {Current page:\MessageBreak
144 \height=\the\pagetotal\space \the\pagetotal\space \free=\the\page@free\MessageBreak
145 \MessageBreak
146 \space needed \the\@tempskipa \space(for #1)}\%

Our last action is to force a page break if there isn’t enough room left.

150 \ifdim \page@free <#1
151 \newpage\fi

When preparing for multicolonn output several things must be done.

152 \def\prepare@multicols{%
We start saving the current \@totalleftmargin and then resetting the \parshape in case we are inside some list environment. The correct indentation for the multicols environment in such a case will be produced by moving the result to the right by \multicol@leftmargin later on. If we would use the value of of \@totalleftmargin directly then lists inside the multicols environment could cause a shift of the output.

153 \multicol@leftmargin \@totalleftmargin
154 \@totalleftmargin\z@
155 \parshape\z@

We also set the register \doublecol@number for later use. This register should contain $2 \times \col@number$. This is also an indicator that we are within a multicols environment as mentioned above.

156 \doublecol@number \col@number
157 \multiply\doublecol@number \tw@
158 \advance\doublecol@number \mult@rightbox
159 \if@boxedmulticols
160 \let\l@kept@firstmark\kept@firstmark
161 \let\l@kept@botmark\kept@botmark
162 \global\let\kept@firstmark\@empty
163 \global\let\kept@botmark\@empty
164 \else

We add an empty box to the main vertical list to ensure that we catch any insertions (held over or inserted at the top of the page). Otherwise it might happen that the \eject is discarded without calling the output routine. Inside the output routine we remove this box again. Again this code applies only if we are on the main vertical list and not within a box. However, it is not enough to turn off interline spacing, we also have to clear \topskip before adding this box, since \topskip is always inserted before the first box on a page which would leave us with an extra space of \topskip if multicols start on a fresh sheet.

165 \nointerlineskip \{\topskip\z@\null\%
166 \output{\%
167 \global\setbox\partial@page\vbox{
168 \%

Now we have to make sure that we catch one special situation which may result in loss of text! If the user has a huge amount of vertical material within the first optional argument that is larger than \premulticols and we are near the bottom of the page then it can happen that not the \eject is
tricking this special output routine but rather the overfull main vertical list. In that case we get another breakpoint through the `\eject` penalty. As a result this special output routine would be called twice and the contents of `\partial@page`, i.e. the material before the `multicols` environment gets lost. There are several solutions to avoid this problem, but for now we will simply detect this and inform the user that he/she has to enlarge the `\premulticols` but for now we will simply detect this and inform the user that he/she has to enlarge the `\premulticols` environment.

Finally we need to record the marks that are present by using a suitable value for the second argument.

Finally we have to initialize `\kept@topmark` by using a suitable value for the second argument.

Finally we have to initialize `\kept@topmark` which should ideally be initialized with the mark that is current on “top” of this page. Unfortunately we can’t use `\topmark` because this register will not always contain what its name promises because \TeX sometimes calls the output routine for float management. Therefore we use the second best solution by initializing it with `\firstmark`. In fact, for our purpose this doesn’t matter as we use `\kept@topmark` only to initialize `\firstmark` and `\botmark` of a following page if we don’t find any marks on the current one.

The next thing to do is to assign a new value to `\vsize`. \TeX maintains the free room on the page (i.e. the page height without the space for already contributed floats) in the register `\@colroom`. We must subtract the height of `\partial@page` to put the actual free room into this variable.

Then we have to calculate the `\vsize` value to use during column assembly. `\set@mult@vsize` takes an argument which allows to make the setting local (`\relax`) or global (`\global`). The latter variant is used inside the output routine below. At this point here we have to make a local change to `\vsize` because we want to get the original value for `\vsize` restored in case this `multicols` environment ends on the same page where it has started.

Now we switch to a new `\output` routine which will be used to put the gathered column material together.

Finally we handle the footnote insertions. We have to multiply the magnification factor and the extra skip by the number of columns since each footnote reduces the space for every column (remember that we have page-wide footnotes). If, on the other hand, footnotes are typeset at the very end of the document, our scheme still works since `\count\footins` is zero then, so it will not change. To allow even further customization the setting of the `\footins` parameters is done in a separate macro.

For the same reason (page-wide footnotes), the \textit{dimen} register controlling the maximum space used for footnotes isn’t changed. Having done this, we must reinsert all the footnotes which are already present (i.e. those encountered when the material saved in `\partial@page` was first processed). This will reduce the free space (i.e. `\pagetotal`) by the appropriate amount since we have changed the magnification factor, etc. above.

Inside `multicols` a `\clearpage` is fairly useless as we aren’t supporting floats. In fact, it can cause harm as it doesn’t know about the `\partial@page` and may therefore result in making columns too long. So we change that to behave like `\newpage` but also check if there are any deferred floats. If so, perhaps the user tried to place them through that `\clearpage` (but that needs to be done before starting the `multicols` environment).

\footnote{During such a call the `\botmark` gets globally copied to `\topmark` by the \TeX program.}
Additionally, we advance \texttt{\baselineskip} which handles any redefinitions of \texttt{\set@floatcmds} extensions without making a new package is another hook to allow people adding their own formula.

Therefore users are able to figure out done in a macro \texttt{\setemergencystretch} ever this is only a guess so at the moment this is

For use with the new \TeX we set \texttt{\emergencystretch} to \texttt{\col@number} × 4pt. However this is only a guess so at the moment this is done in a macro \texttt{\setemergencystretch} which gets the current \texttt{\hsize} and the number of columns as arguments. Therefore users are able to figure out their own formula.

Another hook to allow people adding their own extensions without making a new package is \texttt{\set@floatcmds} which handles any redefinitions of \TeXs internal float commands to work with the \texttt{multicols} environment. At the moment it is only used to redefine \texttt{\@dblfloat} and \texttt{\end@dblfloat}.

Additionally, we advance \texttt{\baselineskip} by \texttt{\multicolbaselineskip} to allow corrections for narrow columns.

\begin{verbatim}
\ifx\@deferlist\@empty
\PackageError{multicol}{Deferred floats not cleared}{A \string\clearpage\space inside multicols acts like deferred floats. MessageBreak
}
\else
\PackageError{multicol}{Deferred floats not cleared}{A \string\clearpage\space inside multicols acts like deferred floats. MessageBreak
}
\fi
\newpage
\end{verbatim}

The \texttt{\hsize} of the columns is given by the formula:

\begin{verbatim}
\linewidth = (\col@number - 1) × \columnsep
\col@number
\end{verbatim}

The formula above has changed from release to release. We now start with the current value of \texttt{\linewidth} so that the column width is properly calculated when we are inside a minipage or a list or some other environment. This will be achieved with:

\begin{verbatim}
\texttt{\hsize} \texttt{\linewidth} \texttt{\advance}\texttt{\hsize} \texttt{\columnsep}
\advance\texttt{\hsize} - \texttt{\col@number}\texttt{\columnsep}
\divide\texttt{\hsize}\texttt{\col@number}
\end{verbatim}

We also set \texttt{\linewidth} and \texttt{\columnwidth} to \texttt{\hsize} In the past \texttt{\columnwidth} was left unchanged. This is inconsistent, but \texttt{\columnwidth} is used only by floats (which aren’t allowed in their current implementation) and by the \texttt{\footnote} macro. Since we want page-wide footnotes\footnote{I’m not sure that I really want page-wide footnotes. But balancing of the last page can only be achieved with this approach or with a multi-path algorithm which is complicated and slow. But it’s a challenge to everybody to prove me wrong! Another possibility is to reimplement a small part of the \texttt{fire_up} procedure in \TeX (the program). I think that this is the best solution if you are interested in complex page makeup, but it has the disadvantage that the resulting program cannot be called \TeX thereafter.} this simple trick saved us from rewriting the \texttt{\footnote} macros. However, some applications referred to \texttt{\columnwidth} as the “width of the current column” to typeset displays (the \texttt{amsmath} package, for example) and to allow the use of such applications together with \texttt{multicol} this is now changed.

Before we change \texttt{\linewidth} to the new value we record its old value in some register called \texttt{\full@width}. This value is used later on when we package all columns together.

\begin{verbatim}
\full@width \linewidth
\linewidth \hsize
\linewidth \hsize
\columnwidth \hsize
\end{verbatim}

This macro is used to set up the parameters associated with footnote floats. It can be redefined by applications that require different amount of spaces when typesetting footnotes.

\begin{verbatim}
\def\init@mult@footins{%
\multiply\skip \footins \col@number
\multiply\count\footins \col@number
\multiply\skip \footins \col@number
\}
\end{verbatim}

Since we have to set \texttt{\col@number} columns on one page, each with a height of \texttt{\col@room}, we have to assign \texttt{\vs} = \texttt{\col@number} × \texttt{\col@room} in order to collect enough material before entering the \texttt{\output} routine again. In fact we have to add another \texttt{\col@number - 1} × \texttt{\baselineskip - \topskip} if you think about it.
But this might not be enough since we use \texttt{vsplit} later to extract the columns from the gathered material. Therefore we add some ‘extra lines,’ one for each column plus a corrective action depending on the value of the ‘\texttt{collectmore}’ counter. The final value is assigned globally if \texttt{#1} is \texttt{global} because we want to use this macro later inside the output routine too.

Here is the \texttt{dimen} register we need for saving away the outer value of \texttt{\@totalleftmargin}.

In versions prior to 1.8r the balancing at the end of the environment was done by changing the output routine from \texttt{\mult@column@out} to \texttt{\balance@column@out}. As it turned out that this has a couple of issues when the last columns should not be balanced after all (for example because they contained several \texttt{columnbreak} commands we now stay with one output routine for the environment and only signal that we reached the end of the environment by marking it with a special penalty that we can check for later.

When the end of the \texttt{multicols} environment is sensed we have to balance the gathered material. Depending on whether or not we are inside a boxed multicol different things must happen. But first we end the current paragraph with a \texttt{\par} command.

In boxed mode we have to close the box in which we have gathered all material for the columns. But before we do this we need to remove any space at the end of the box as we don’t want to use this in balancing. Because of the \texttt{color@endgroup} this can’t be done later in \texttt{\balance@columns} as the color command will hide it.\footnote{This once caused a puzzling bug where some of the material was balanced twice, resulting in some overprints. The reason was the \texttt{\eject} which was placed at the end of the contribution list. Then the \texttt{page_builder} was called (an explicit \texttt{\penalty} will empty the contribution list), but the line with the \texttt{\eject} didn’t fit onto the current page. It was then reconsidered after the output routine had ended, causing a second break after one line.}

Now we call \texttt{\balance@columns} the routine that balances material stored in the box \texttt{\mult@box}.

After balancing the result has to be returned by the command \texttt{\page@sofar}. But before we do this we reinsert any marks found in box \texttt{\mult@box}.

This finishes the code for the “boxed” case.

If there was a \texttt{\columnbreak} on the very last line all material will have been moved to the \texttt{\colbreak@box}. Thus the the galley will be empty and no output routine gets called so that the text is lost. To avoid this problem (though unlikely) we check if the current galley is empty and the \texttt{\colbreak@box} contains text and if so return that to the galley. If the galley is non-empty any material in \texttt{\colbreak@box} is added in the output routine since it needs to be put in front.

If we are in an unrestricted \texttt{multicols} environment we end the current paragraph above with \texttt{\par} but this isn’t sufficient since \texttt{\TeX}s \texttt{page_builder} will not totally empty the contribution list.\footnote{Therefore we must also add an explicit \texttt{\penalty}. Now the contribution list will be emptied and, if its material doesn’t all fit onto the current page then the output routine will be called before we change it. At this point the contribution list will be emptied before the output routine starts to work.}
Now it’s time to return any footnotes if we are in unrestricted mode. In boxed mode footnotes are kept inside, but in that case we have to write another column status into the .aux file to support \docolaction in case we have nested environments.

\if@boxedmulticols
  \mc@col@status@write
\else
  \reinsert@footnotes
\fi

We also take a look at the amount of free space on the current page to see if it’s time for a page break. The vertical space added thereafter will vanish if \enough@room starts a new page. But there is one catch. If the \end{multicols} is at the top of which can happen if there is a break point just before it (such as end ending environment) which was chosen. In that case we would do the next page using the internal \vsize for multicol collection which is a disaster. So we better catch this case. Fortunately we can detect it by looking at \pagegoal.

\ifdim \pagegoal=\maxdimen
  \global\vsize@$\@colroom$
\else
  \enough@room\postmulticols
  \fi
\fi

There is one more thing to do: the balanced result of the environment is supposed to have a \prevdepth of zero as we backed up by its real prevdepth within \page@sofar. However if the balancing happened in the output routine then \TeX reverts to the \prevdepth that was current before the OR once the OR has finished. In short \prevdepth is something you can’t set globally it is alway local to the current list being built. Thus we need to set it back to zero here to avoid incorrect spacing.

\prevdepth@z@

If statistics are required we finally report that we have finished everything.

\mult@info@z@
\{Ending environment
\if@boxedmulticols
  \space(boxed mode)\fi
\}

Let us end this section by allocating all the registers used so far.

\newcount@unbalance
\newcount@collectmore

We also set the ‘unbalance’ counter to its default. This is done globally since \TeX counters are always changed this way.\footnote{Actually, we are still in a group started by the \begin macro, so \global must be used anyway.}
In the new \LaTeX{} release \texttt{\col@number} is already allocated by the kernel, so we don’t allocate it again.

\begin{verbatim}
\newcount\col@number
\newcount\doublecol@number
\newcount\multicoltolerance
\newcount\multicolpretolerance
\newdimen\full@width
\newdimen\page@free
\newdimen\premulticols
\newdimen\postmulticols
\newskip\multicolsep
\newskip\multicolbaselineskip
\newbox\partial@page
\newbox\last@line
\end{verbatim}

And here are their default values:

\begin{verbatim}
c@unbalance = 0
\end{verbatim}

To allow checking whether some macro is used within the \texttt{multicols} environment the counter \texttt{\col@number} gets a default of 1 outside the environment.

\begin{verbatim}
\col@number = 1
\end{verbatim}

\texttt{\multicoltolerance} = 9999
\texttt{\multicolpretolerance} = -1
\texttt{\premulticols} = 50pt
\texttt{\postmulticols} = 20pt
\texttt{\multicola@sep} = 12pt plus 4pt minus 3pt
\texttt{\multicola@baselineskip} = 0pt

\section*{4.4 The output routines}

We first start with some simple macros. When typesetting the page we save the columns either in the box registers 0, 2, 4, \ldots (locally) or 1, 3, 5, \ldots (globally). This is \texttt{Plain TeX} policy to avoid an overflow of the save stack.

Therefore we define \texttt{\process@cols} macro to help us in using these registers in the output routines below. It has two arguments: the first one is a number; the second one is the processing information. It loops starting with \texttt{\count@=#1} (\texttt{\count@} is a scratch register defined in \texttt{Plain TeX}), processes argument \texttt{\count@}, processes argument \texttt{\count@} again, etc. until \texttt{\count@} is higher than \texttt{\doublecol@number}. It might be easier to understand it through an example, so we define it now and explain its usage afterwards.

\begin{verbatim}
\def\process@cols#1#2{\count@#1\relax
\loop
\the\count@
\advance\count@\tw@
\ifnum\count@<\doublecol@number
\repeat}
\end{verbatim}

Now we have to check if the box in question is void, because the operation \texttt{\wd\langle\texttt{number}\rangle} on a void box will not change its dimension (sigh).

\begin{verbatim}
{\ifvoid\count@
\setbox\count@\hbox to\hsize{\relax}
\else\wd\count@\hsize\fi}\
\end{verbatim}

We now define \texttt{\page@sofar} to give an example of the \texttt{\process@cols} macro. \texttt{\page@sofar} should output everything prepared by the balancing routine \texttt{\balance@columns}.

\begin{verbatim}
\def\page@sofar{\balance@columns
\end{verbatim}

\texttt{\balance@columns} prepares its output in the even numbered scratch box registers. Now we output the columns gathered assuming that they are saved in the box registers 2 (left column), 4 (second column), \ldots However, the last column (i.e. the rightmost) should be saved in box register 0.\footnote{You will see the reason for this numbering when we look at the output routines \texttt{\multicolumn@out} and \texttt{\balance@columns@out}.} First we ensure that the columns have equal width. We use \texttt{\process@cols} for this purpose, starting with \texttt{\count@ = \mult@rightbox}. Therefore \texttt{\count@} loops through \texttt{\mult@rightbox}, \texttt{\mult@rightbox + 2}, \ldots (to \texttt{\doublecol@number}).

\begin{verbatim}
\process@cols\mult@rightbox
\end{verbatim}

We have to check if the box in question is void, because the operation \texttt{\wd\langle\texttt{number}\rangle} on a void box will not change its dimension (sigh).

\begin{verbatim}
{\ifvoid\count@
\setbox\count@\hbox to\hsize{\relax}
\else\wd\count@\hsize\fi}
\end{verbatim}

Now we give some tracing information.

\begin{verbatim}
\count@\col@number \advance\count@\m@ne
\mult@info\count@
\{Column spec: \the\full@width\space = indent
\hspace{\multicol@leftmargin}\space
\count@\space\space\multicol@leftmargin\space
\postmulticols\space\space\multicol@leftmargin\space\space\postmulticols\space\space\multicol@leftmargin\space
}\MessageBreak
\end{verbatim}

At this point we should always be in vertical mode.

\begin{verbatim}
\ifvmode\else\errmessage{Multicol Error}\fi
\end{verbatim}

Now we put all columns together in an \texttt{\hbox} of width \texttt{\full@width} (shifting it by \texttt{\multicola@leftmargin} to the right so that it will
be placed correctly if we are within a list environment) and separating the columns with a rule if desired.

The box containing the columns has a large height and thus will always result in using \lineskip if the normal \baselineskip calculations are used. We therefore better cancel that process.

\[\text{\textbackslash kern-\textbackslash dimen\textbackslash tw@}\]

However, in case one of the columns was unusually deep \TeX may have tried some corrective actions in which case backing up by the saved value will not bring us back to the baseline. A good indication for this is a depth of \maxdepth though it is not an absolute proof. If the option grid is used \mc@gridwarn will expand to this, otherwise to \maxdimen in which case this warning will not show up.

\[\text{\textbackslash ifdim\textbackslash dimen\textbackslash tw@ > \mc@gridwarn}\]
\[\PackageWarning{multicol}{\textbf{Very deep columns!}}\]
\[\text{Grid alignment might be broken}\]
\[\text{\textbackslash fi}\]

Now after typesetting the box we back up to its baseline by using the value stored in \dimen2 (which will hold the largest depth found on any column).

\[\text{\textbackslash kern-\textbackslash dimen\textbackslash tw@}\]

By default the vertical rule between columns will be in \normalcolor.

\[\def\columnseprulecolor{\normalcolor}\]

Before we tackle the bigger output routines we define just one more macro which will help us to find our way through the mysteries later. \reinsert@footnotes will do what its name indicates: it reinserts the footnotes present in \footinbox so that they will be reprocessed by \TeX’s page\_builder.

Instead of actually reinserting the footnotes we insert an empty footnote. This will trigger insertion mechanism as well and since the old footnotes are still in their box and we are on a fresh page \skipfootins should be correctly taken into account.

\[\def\reinsert@footnotes{\ifvoid\footins\else\insert\footins{}\fi}\]

This curious definition is used as the space at the bottom of a column if we implement \raggedcolumns. Normally one only appends \vfill in that case but this is actually wrong for columns that are more or less full: by adding a glue at the bottom such a column doesn’t have any depth any more but without it the material would be allowed a depth of \maxdepth. So we allow shrinking by that amount. This only makes a difference if the box would otherwise become overfull and shrinking never exceeds the specified value, so we should be fine.

\[\def\vfilmaxdepth{\vskip \z@ \plus .001\fil \@minus \maxdepth}\]
Now we can’t postpone the difficulties any longer. The \texttt{\multicolumnout} routine will be called in two situations. Either the page is full (i.e., we have collected enough material to generate all the required columns) or a float or marginpar or a \texttt{\clearpage} is sensed. In the latter case the \texttt{\outputpenalty} is less than $-10000$, otherwise the penalty which triggered the output routine is higher. Therefore it’s easy to distinguish both cases: we simply test this register.

\begin{verbatim}
def\multicolumnout{
  \ifnum\outputpenalty <-\@M
    \ifvoid\colbreak@box\else
      \mult@info{Re-adding forced break(s) for splitting}\
      \setbox\@cclv\vbox{\unvbox\colbreak@box\
        \penalty-\@Mv\unvbox\@cclv}\
    \fi
  \else
    \ifvoid\@cclv \else
      \unvbox\@cclv
      \ifnum\outputpenalty=\@M
        \vsplit\@cclv to\dimen@\set@keptmarks
        \ifshr@nking\vfilmaxdepth\fi\fi
      \fi
    \fi
  \fi
}
\end{verbatim}

If this was a \texttt{\clearpage}, a float or a marginpar we call \texttt{\speci@ls} otherwise we construct the final page. For the next block of code see comments in section 7.2.

\begin{verbatim}
\splittopskip\topskip
\splitmaxdepth\maxdepth
\boxmaxdepth\maxdepth
\end{verbatim}

Then we calculate the current column height (in \texttt{\dimen@}). Note that the height of \texttt{\partial@page} is already subtracted from \texttt{\@colroom} so we can use its value as a starter.

\begin{verbatim}
\dimen@\@colroom
\end{verbatim}

But we must also subtract the space occupied by footnotes on the current page. Note that we first have to reset the skip register to its normal value. Again, the actual action is carried out in a utility macro, so that other applications can modify it.

\begin{verbatim}
\divide\skip\footins\col@number
\ifvoid\footins \else
  \leave@mult@footins
\fi
\end{verbatim}

And there is one more adjustment that we have to make: if the user has issue a \texttt{\enlargethispage} command then the height the \texttt{\@kludgeins} box will be the negation of the size by which the page should be enlarged. If the star form of this command has been used then we also need to shrink the resulting column.

That local change will be reverted at the end of the output routine So for the next page the original state will be reestablished. However, in theory there is a possibility to sneak in a whole multicols environment into the running header definition. If that happens then it will also be affected by this change—too bad I think.

\begin{verbatim}
\ifvbox \@kludgeins
  \advance\dimen@ -\ht\@kludgeins
  \ifdim\wd\@kludgeins>\z@
    \shr@nkingtrue
  \fi
\fi
\end{verbatim}

Now we are able to \texttt{\vsplit} off all but the last column. Recall that these columns should be saved in the box registers 2, 4,... (plus offset).

\begin{verbatim}
\process@cols\mult@gfirstbox{\
  \setbox\count@\vsplit\@cclv to\dimen@\set@keptmarks
  \setbox\count@\vbox to\dimen@{\unvbox\count@\ifshr@nking\vfilmaxdepth\fi}\
  \setbox\mult@rightbox\vsplit\@cclv to\dimen@
  \set@keptmarks
  \setbox\mult@rightbox\vbox to\dimen@{\unvbox\mult@rightbox\ifshr@nking\vfilmaxdepth\fi}\
}\fi
\end{verbatim}

Then the last column follows.

\begin{verbatim}
\ifvoid\@cclv \else
  \unvbox\@cclv
  \ifnum\outputpenalty=\@M
    \vsplit\@cclv to\dimen@\set@keptmarks
    \ifshr@nking\vfilmaxdepth\fi\fi
  \fi
\fi
\end{verbatim}

Having done this we hope that box 255 is emptied. If not, we reinsert its contents.
In this case a footnote that happens to fall into the leftover bit will be typeset on the wrong page. Therefore we warn the user if the current page contains footnotes. The older versions of \texttt{multicol} produced this warning regardless of whether or not footnotes were present, resulting in many unnecessary warnings.

If the `tracingmulticols` counter is 4 or higher we also add a rule.

To get a correct marks for the current page we have to (locally) redefine \texttt{\textbackslash firstmark} and \texttt{\textbackslash botmark}. If \texttt{\kept@firstmark} is non-empty then \texttt{\kept@botmark} must be non-empty too so we can use their values. Otherwise we use the value of \texttt{\kept@topmark} which was first initialized when we gathered the \texttt{\partial@page} and later on was updated to the \texttt{\botmark} for the preceding page.

We also initialize \texttt{\topmark} with \texttt{\kept@topmark}. This will make this mark okay for all middle pages of the \texttt{multicol} environment.

After the page is shipped out we have to prepare the keep marks for the following page. \texttt{\kept@topmark} and \texttt{\kept@botmark} are set back now as it was changed above.

Now we reset \texttt{\@colroom} to \texttt{\@colht} which is \LaTeX{}’s saved value of \texttt{\textheight}. We also have to reset the recorded position of the last \texttt{\marginpar} as well as the recorded size of in-text floats as we are now on a new page.

\footnote{This will produce a lot of overhead since both output routines are held in memory. The correct solution would be to redesign the whole output routine used in \LaTeX{}.}
Then we process deferred floats waiting for their chance to be placed on the next page.

If the user is interested in statistics we inform him about the amount of space reserved for floats.

Having done all this we must prepare to tackle the next page. Therefore we assign a new value to \vsize. New, because \partial@page is now empty and \@colroom might be reduced by the space reserved for floats.

We left out two macros: \process@deferreds and \speci@ls.

If the document ends in the middle of a multicol environment, e.g., if the user forgot the \end{multicols}, \TeX adds a very negative penalty to the end of the galley which is intended to signal the output routine that it is time to prepare for shipping out everything remaining. Since inside multicol the output routine of \TeX is disabled sometimes we better check for this case: if we find a very negative penalty we produce an error message and run the default output routine for this case.

For the next block of code see comments in section 7.2.
If we encounter a float or a marginpar in the current implementation we simply warn the user that this is not allowed. Then we reinsert the page and its footnotes.

Additionally we empty the \@currlist to avoid later error messages when the \LaTeX output routine is again in force. But first we have to place the boxes back onto the \@freelist. (\@elts default is \relax so this is possible with \xdef.)

\@tempb \endgroup

Our next action is to (globally) empty \@deferlist and assign a new meaning to \@elt. Here \@scolelt is a macro that looks at the boxes in a list to decide whether they should be placed on the next page (i.e. on \@toplist or \@botlist) or should wait for further processing.

Now we call \@tempb which has the form

\@elt (box register) \@elt (box register)...

So \@elt (i.e. \@scolelt) will distribute the boxes to the three lists.

\setbox\@cclv \vbox

The \raggedcolumns and \flushcolumns declarations are defined with the help of a new \if... macro.

The actual definitions are simple: we just switch to true or false depending on the desired action. To avoid extra spaces in the output we enclose these changes in \@bsphack...\@esphack.

Now for the last part of the show: the column balancing output routine. Since this code is called with an explicit penalty (\eject) there is no need to check for something special (eg floats). We start by balancing the material gathered.

For this we need to put the contents of box 255 into \mult@box. For the next block of code see also comments in section 7.2. All forced breaks except the last are inside \colbreak@box so all we have to do is to concatenate this box with box \@cclv and put a penalty in between. Here we test if \colbreak@box is void so that the message is only generated if we really add forced breaks and the penalty.

The last column again is a forced break, so here we discard white space as well as that is normally unwanted.

\mult@info\@ne{Re-adding forced break(s) in balancing}%

\setbox\@cclv \vbox

\setbox\@cclv \vbox

If during balancing the columns got too long the flag \iftoo@bad is set to true.

\setbox\@cclv \vbox

In that case we put the material back in box 255 so that we can cut a normal page. The curious set of \vskips we add is necessary to cancel out the \sPLITTOPSki that got added for balancing.
We also have to re-add the end of environment penalty since after this page we may want balance the remaining material.

```
\penalty-\@M\vii
```

We then call the standard multicols output routine which will produce a normal page for us (remember we are still within the OR so some part of the code in \texttt{\multicolumn{out} is actually not doing anything—perhaps this should be cleaned up at some point). This also means that if there was an \texttt{\enlargethispage} present it will apply to this page as \texttt{\multicolumn{out}} will look at the status of \texttt{\@kludgeins}.

```
\multicolumn{out}
```

Because balancing made the columns too long we are sure that there will be some material remaining which was put back onto the main vertical list by \texttt{\multicolumn{out}}. This will also put the explicit \texttt{\vspace} penalty back so the current \texttt{\balancecolumns} output routine will be called again (so we better do not add another penalty or else the OR will be called twice and we may get scrambled results).

```
\else
```

If the balancing went ok, we are in the position to apply \texttt{\pagesofar}. But first we have to set \texttt{\vsize} to a value suitable for one column output.

```
\global\vsize\@colroom
```

We also have to look at \texttt{\@kludgeins} and generate a new \texttt{\insert} in case there was one present due to an \texttt{\enlargethispage} command.

```
\ifvbox\@kludgeins\insert\@kludgeins
```

Then we \texttt{\unvbox\@kludgeins} and the gathered material to the main vertical list.

```
\unvbox\@kludgeins\partial@page
```

Then we return the first and bottom mark and the gathered material to the main vertical list.

```
\return\nemptymark(first)\kept@firstmark
```

We need to add a penalty at this point which allows to break at this point since calling the output routine may have removed the only permissible break point thereby “glueing” any following skip to the balanced box. In case there are any weird settings for \texttt{\multicolsep} etc. this could produce funny results.

```
\penalty\z@\fi
```

As we already know, reinserting of footnotes will be done in the macro \texttt{\endmulticols}.

This macro now does the actual balancing.

```
\def\balancecolumns{%
```

We start by setting the kept marks by updating them with any marks from this box. This has to be done \texttt{before} we add a penalty of \texttt{-10000} to the top of the box, otherwise only an empty box will be considered.

```
\get@keptmarks\mult@box
```

We then continue by resetting trying to remove any discardable stuff at the end of \texttt{\mult@box}. This is rather experimental. We also add a forced break point at the very beginning, so that we can split the box to height zero later on, thereby adding a known \texttt{\splittopskip} glue at the beginning.

```
\setbox\mult@box\vbox{%
```

Then follow values assignments to get the \texttt{\vsplit} right. We use the natural part of \texttt{\topskip} as the natural part for \texttt{\splittopskip} and allow for a bit of undershoot and overshoot by adding some stretch and shrink.

```
\@tempdima\topskip
```

The next step is a bit tricky: when \TeX assembles material in a box, the first line isn't preceded by interline glue, i.e. there is no parameter like \texttt{\boxtopskip} in \TeX. This means that the baseline of the first line in our box is at some unpredictable point depending on the height of the largest character in this line. But of course we want all columns to align properly at the baselines of their first lines. For this reason we have opened \texttt{\mult@box} with a
\penalty -10000. This will now allow us to split off from \mult@box a tiny bit (in fact nothing since the first possible break-point is the first item in the box). The result is that \splittopskip is inserted at the top of \mult@box which is exactly what we like to achieve.

592 \setbox\@tempboxa\vsplit\mult@box to\z@

Next we try to find a suitable starting point for the calculation of the column height. It should be less than the height finally chosen, but large enough to reach this final value in only a few iterations. The formula which is now implemented will try to start with the nearest value which is a multiple of \baselineskip. The coding is slightly tricky in \TeX and there are perhaps better ways . . .

593 \@tempdima\ht\mult@box
594 \advance\@tempdima\dp\mult@box
595 \divide\@tempdima\col@number

The code above sets \@tempdima to the length of a column if we simply divide the whole box into equal pieces. To get to the next lower multiple of \baselineskip we convert this dimen to a number (the number of scaled points) then divide this by \baselineskip (also in scaled points) and then multiply this result with \baselineskip assigning the result to \dimen@. This makes \dimen@ ≤ to \@tempdima.

596 \count@\@tempdima
597 \divide\count@\baselineskip
598 \dimen@\count@\baselineskip

Next step is to correct our result by taking into account the difference between \topskip and \baselineskip. We start by adding \topskip; if this makes the result too large then we have to subtract one \baselineskip.

599 \advance\dimen@\topskip
600 \ifdim \dimen@>\@tempdima
601 \advance\dimen@-\baselineskip
602 \fi

As a further restriction we want to see a minimum number of rows in the balanced result based on the setting of the counter \minrows. If the starting value is lower we adjust.

603 \@tempdima\dimexpr\topskip+\c@minrows*\baselineskip-\baselineskip\relax
604 \ifnum\dimen@<\@tempdima
605 \mult@info\one
606 {Start value \the\dimen@ \space -> \the\@tempdima \space (corrected for \minrows)}\%
607 \dimen@\@tempdima
608 \fi

At the user’s request we start with a higher value (or lower, but this usually only increases the number of tries).

612 \advance\dimen@c@unbalance\baselineskip
613 We type out statistics if we were asked to do so.
614 \mult@info\one
615 {Balance columns\oneline:
616 \ifnum\c@unbalance=\z@else
617 (off balance=\number\c@unbalance)\fi
618 \@gobbletwo}%
619 But we don’t allow nonsense values for a start.
620 \ifnum\dimen@<\topskip
621 \mult@info\one
622 {Start value \the\dimen@ \space -> \the\topskip \space (corrected)}\%
623 \dimen@\topskip
624 \fi

Now we try to find the final column height. We start by setting \vbadness to infinity (i.e. 10000) to suppress underfull box reports while we are trying to find an acceptable solution. We do not need to do it in a group since at the end of the output routine everything will be restored. The setting of the final columns will nearly always produce underfull boxes with badness 10000 so there is no point in warning the user about it.

625 \vbadness\@M

We also allow for overfull boxes while we trying to split the columns. They can easily happen if we have objects with unusual depth.

626 \vfuzz \maxdimen

The variable \last@try will hold the dimension used in the previous trial splitting. We initialize it with a negative value.

627 \last@try-\p@
628 \loop

In order not to clutter up \TeX’s valuable main memory with things that are no longer needed, we empty all globally used box registers. This is necessary if we return to this point after an unsuccessful trial. We use \process@cols for this purpose, starting with \mult@grightbox. Note the extra braces around this macro call. They are needed since \Process@Cols \repeat mechanism cannot be nested on the same level of grouping.

629 \process@cols\mult@grightbox
630 {\global\setbox\count@\voidb@x}\%

The contents of box \mult@box are now copied globally to box \mult@grightbox. (This will be the right-most column, as we shall see later.)
We start with the assumption that the trial will be successful. If we end up with a solution that is too bad we set `too@bad` to `true`. We also assume that all forced breaks (if any) will be used during balancing. If this is not the case we record this in `forcedbreak@leftover`.

After splitting we need to ensure that there isn’t any space at the bottom, so we rebox once more.

After every split we check the badness of the resulting column, normally the amount of extra white in the column.

If this badness is larger than the allowed column badness we reject this solution by setting `too@bad` to `true`.

There is one subtle point here: while all other constructed boxes have a depth that is determined by `\splitmaxdepth` and/or `\boxmaxdepth` the last box will get a natural depth disregarding the original setting and the value of `\splitmaxdepth` or `\boxmaxdepth`. This means that we may end up with a very large depth in box `\mult@rightbox` which would make the result of the testing incorrect. So we change the value by unboxing the box into itself.

We also save a copy `\mult@firstbox` at its “natural” size for later use.

After `\process@cols` has done its job we have the following situation:

<table>
<thead>
<tr>
<th>Box</th>
<th>Content</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>\mult@rightbox</code></td>
<td>all material</td>
</tr>
<tr>
<td><code>\mult@gfirstbox</code></td>
<td>first column</td>
</tr>
<tr>
<td><code>\mult@gfirstbox + 2</code></td>
<td>second column</td>
</tr>
<tr>
<td>...</td>
<td></td>
</tr>
<tr>
<td><code>\mult@rightbox</code></td>
<td>last column</td>
</tr>
</tbody>
</table>

We report the height of the first column, in brackets the natural size is given.

If `\raggedcolumns` is in force older releases of this file also shrank the first column to its natural height at this point. This was done so that the first column doesn’t run short compared to later columns but it is actually producing incorrect results (overprinting of text) in boundary cases, so since version v1.5q `\raggedcolumns` means allows for all columns to run slightly short.

Then we give information about the last column.\footnote{With \TeX{} version 3.141 it is now possible to use \LaTeX{}'s `\newlinechar` in the `\message` command, but people with older \TeX{} versions will now get `\textbackslash n` instead of a new line on the screen.}

Some tracing code that we don’t compile into the production version unless asked for. It will produce huge listings of the boxes involved in balancing in the transcript file.
We check whether our trial was successful. The test used is very simple: we merely compare the first and the last column. Thus the intermediate columns may be longer than the first if \raggedcolumns is used. If the right-most column is longer than the first then we start over with a larger value for \dimen@.

If the height of the last box is too large we mark this trial as unsuccessful.

To ensure that there isn’t a forced break in the last column we try to split off a box of size \maxdimen from \mult@rightbox (or rather from a copy of it). This should result in a void box after the split, unless there was a forced break somewhere within the column in which case the material after the break would have stayed in the box.

Thus if \tempboxa is void we have a valid solution. In this case we take a closer look at the last column to decide if this column should be made as long as all other columns or if it should be allowed to be shorter. For this we first have to rebox the column into a box of the appropriate height. If tracing is enabled we then display the badness for this box.

We then compare this badness with the allowed badness for the final column. If it does not exceed this value we use the box, otherwise we rebox it once more and add some glue at the bottom.
Finally the switch \texttt{too@bad} is tested. If it was made true either earlier on or due to a rightmost column being too large we try again with a slightly larger value for \texttt{\dimen0}.

\iftoo@bad
\else
\fi

Amount that balancing is allowed to overflow the available column space. We default to 12pt which means about one line in most layouts.

\newdimen\maxbalancingoverflow
\maxbalancingoverflow=12pt

When putting the final column together we want overfull information:

\if@boxedmulticols\else
\fi

Finally end the \texttt{\ifforcedbreak@leftover} conditional.

\newdimen\page@sofar
\process@col\mult@rightbox
\if@tempcnta\count@0
\else
\fi

4.5 The box allocations

Early releases of these macros used the first box registers 0, 2, 4, . . . for global boxes and 1, 3, 5, . . . for the corresponding local boxes. (You might still find some traces of this setup in the documentation, sigh.) This produced a problem at the moment we had more than 5 columns because then officially allocated boxes were overwritten by the algorithm. The new release now uses private box registers.

5 New macros and hacks for version 1.2

If we don’t use \TeX 3.0 \texttt{\texttt{emergencystretch}} is undefined so in this case we simply add it as an unused \texttt{(dimen)} register.

My tests showed that the following formula worked pretty well. Nevertheless the \texttt{\texttt{setemergencystretch}} macro also gets \texttt{\texttt{hsize}} as second argument to enable the user to try different formulae.

Even if this should be used as a hook we use a \texttt{@} in the name since it is more for experts.

Sometimes we want to return the value of a “kept” mark into a \texttt{\mark} node on the main vertical list. This is done by the function \texttt{\texttt{returnnonemptymark}}. As the name suggests it only acts if the replacement text of the kept mark is non-empty. This is done to avoid adding an empty mark when no mark was actually present. If we would nevertheless add such a mark it would be regarded as a valid \texttt{\firstmark} later on.

For debugging purposes we take a look at the value
of the kept mark that we are about to return. This code will get stripped out for production.

\mult@info{tw@}{Returned #1 mark:\MessageBreak \meaning#2}\
\nobreak
\fi
\}marktrace

Since the contents of the mark may be arbitrary \LaTeX{} code we better make sure that it doesn’t get expanded any further. (Some expansion have been done already during the execution of \markright or \markboth.) We therefore use the usual mechanism of a toks register to prohibit expansion.\footnote{Due to the current definition of \markright etc. it wouldn’t help to define the \protect command to prohibit expansion as any \protect has already vanished due to earlier expansions.}

\toks@\expandafter{#2}\
\mark{\the	oks@}\

We don’t want any breakpoint between such a returned mark and the following material (which is usually just the box where the mark came from).

\nobreak\fi}

If we have some material in a box register we may want to get the first and the last mark out of this box. This can be done with \get@keptmarks which takes one argument: the box register number or its nick name defined by \newbox.

\def\get@keptmarks#1{\begingroup\vbadness@M\
\setbox#1\copy#1\setbox#1\vsplit#1\maxdimen

Therefore we can now set the kept marks which is a global operation and afterwards close the group. This will restore the original box contents.

\set@keptmarks\endgroup

For debugging we take again a look at the box dimension which shouldn’t have changed.

\typeout{Mark box #1 before: \ht\the\ht#1, \dp\the\dp#1}\
\}marktrace

The macro \set@keptmarks is responsible for setting \kept@firstmark and \kept@botmark, by checking the current values for \splitfirstmark and \splitbotmark.

\def\set@keptmarks{\ifx\kept@firstmark\@empty\else
\mult@info{tw@}{Set kept first mark:\MessageBreak \meaning\kept@firstmark\@gobbletwo}}\fi

\endgroup

We always try to set the bottom mark to the \splitbotmark but of course only when there has been a \splitbotmark at all. Again, we assume that an empty \splitbotmark means that the split off box part didn’t contain any marks at all.

\expandafter\def\expandafter\@tempa\expandafter{\splitbotmark}\maxdimen

The \prep@keptmarks function is used to initialize the kept marks from the contents of \partial@page, i.e. the box that holds everything from the top of the current page prior to starting the \multicols environment. However, such a box is only available if we are not producing a boxed \multicols.

There are situations when we may have some space at the end of a column and this macro here will attempt to get rid of it. The typical \LaTeX sequence is a series of self-canceling glues so if we remove them recursively we are usually fine.

Special care is needed with handling \vspace* as that corresponds to \penalty10000, \vskip \skip, followed by \vskip 0pt. If we see this sequence going backwards in the vertical list we assume that this is a “desired” space. We therefore stop the recursion and reinsert the spaces.

As the \multicols code sometimes add an explicit penalty at the end of a column we first attempt to remove it in case it is there.

Save a previous skip (if there) and then remove it, we can’t really tell the difference between no skip and a skip of zero but that’s life.

If it was a zero skip (or none) we save the next previous skip (if any).

If this one again was zero (or more likely not there in the first place) we stop.

Otherwise we remove this “real” skip. Then we look if it was preceded by a penalty of 10000 (i.e., a \nobreak)

If so this was a \vspace* or something equivalent to it. Therefore we reintroduce the skips and stop. Otherwise we recurse.

If the first skip was a non-zero skip we recurse as well.

A helper for producing info messages
6 Fixing the \columnwidth

If we store the current column width in \columnwidth we have to redefine the internal \footnotetext macro to use \textwidth for the width of the footnotes rather than using the original definition.

Starting with version v1.5r this is now done in a way that the original definition is still used, except that locally \columnwidth is set to \textwidth.

This solves two problems: first redefinitions of \footnotetext done by a class will correctly survive and second if multicols is used inside a minipage environment the special definition of \footnotetext in that environment will be picked up and not the one for the main galley (the latter would result in all footnotes getting lost in that case).

See the definition of the \multicols command further up for the exact code.

7 Further extensions

This section does contain code for extensions added to this package over time. Not all of them may be active, some might sit dormant and wait for being activated in some later release.

7.1 Not balancing the columns

This is fairly trivial to implement. we just have to disable the balancing output routine and replace it by the one that ships out the other pages.

The code for this environment was suggested by Matthias Clasen.

939 ⟨\*nobalance\rangle
940 \@namedef{multicols*}{% If we are not on the main galley, i.e., inside a box of some sort, that approach will not work since we don’t have a vertical size for the box so we better warn that we balance anyway.
941 \ifinner
942 \PackageWarning{multicol}% {multicols* inside a box does not make sense.\MessageBreak Going to balance anyway}%
943 \else
944 \fi
945 \def\balance@columns@out \multi@column@out \penalty-\@Mvi }%
946 \begin{multicols}
947 \@namedef{endmulticols*}{% When ending the environment we simply end the inner multicols environment, except that we better also stick in some stretchable vertical glue so that the last column still containing text is not vertically stretched out.
948 \par
949 \ifdim\lastskip>\z@ \vskip-\lastskip \fi
950 \ifdim \prevdepth>\z@ \vskip-\ifdim\prevdepth>\boxmaxdepth \boxmaxdepth \else \prevdepth \fi
951 \fi
952 \ifshr@nking\else \vfil \fi
953 \end{multicols}}
954 ⟨/nobalance\rangle

30
7.2 Manual column breaking

The problem with manual page breaks within \texttt{multicols} is the fact that during collection of material for all columns a page-forcing penalty (i.e. -10000 or higher) would stop the collecting pass which is not quite what is desired. On the other hand, using a penalty like -9999 would mean that there would be occasions where the \texttt{\vsplitting} operations within \texttt{multicols} would ignore that penalty and still choose a different break point.

For this reason the current implementation uses a completely different approach. In a nutshell it extends the \LaTeX\ output routine handling by introducing an additional penalty flag (i.e., a penalty which is forcing but higher than -10000 so that the output routine can look at this value and thus knows why it has been called).

Inside the output routine we test for this value and if it appears we do two things: save the galley up to this point in a special box for later use and reduce the \texttt{\vsize} by the height of the material seen. This way the forcing penalty is now hidden in that box and we can restart the collection process for the remaining columns. (This is done in \texttt{\specs} above.)

In the output routines that do the \texttt{\vsplitting} either for balancing or for a full page we simply combine box 255 with the saved box thus getting a single box for splitting which now contains forcing breaks in the right positions.

\texttt{\columnbreak} is modeled after \texttt{\pagebreak} except that we generate a penalty -10005.

\begin{verbatim}
\def\columnbreak{% We have to ensure that it is only used within a \texttt{multicols} environment since if that penalty would be seen by the unmodified \LaTeX\ output routine strange things would happen.
  \ifnum\col@number<\tw@ \PackageError{multicol}{\noexpand\columnbreak outside multicols}{} \else
    \ifvmode \penalty -\@Mv \relax \else \@bsphack \vadjust{\penalty -\@Mv \relax} \@esphack \fi
  \fi}
\end{verbatim}

Need a box to collect the galley up to the column break.

\begin{verbatim}
\newbox\colbreak@box \end{verbatim}

7.3 Supporting right-to-left languages

\texttt{\LR\column@boxes} is called when we are assembling the columns for left to right typesetting. When we start we are inside an \texttt{\hbox} of full width. Left to right typesetting is fairly easy, we basically output each column box intermixed with vertical rules and proper spacing. As this happens inside a box of a defined width the rules and the columns automatically get into the right positions.

\begin{verbatim}
def\LR\column@boxes{% We loop through the columns with \texttt{\process@cols}
  \process@cols\mult@gfirstbox{% If the depth of the current box is larger than the maximum found so far in \texttt{\dimen2} we update that register for later use.
    \ifdim\dp\count@>\dimen\tw@ \global\dimen\tw@\dp\count@ \fi \mc@col@status@write \box\count@
  \hss{\columnseprulecolor\vrule \@width\columnseprule}\hss}
}\end{verbatim}

Assembling the boxes for right to left typesetting is far more complicated. When I first tried to build a solution for this my thinking was that all that is necessary to do is to reverse the order of the columns.
But such an approach produces a subtle bug: If we work this way then the first column put on the page will be the last column of the text to read, and this means that the order in which \TeX{} executes write statements or assembles mark material will not happen in the order of the textual flow. So if, for example each column contains a section command then these sections will appear in reverse order in the table of content.

For this reason some amount of gymnastics is needed to add the columns in their natural flow.

First step is to put all rules in the right place (without adding the comes which are instead represented by a space of \hsize).

At this point in the code our typesetting reference point is at the right end of the rightmost column (or rather where that column should appear).

We are now typesetting all columns by first backing up by their width (which is \hsize) then typesetting the box and then backing up again, but this time further, i.e., also across the column separation. That will then enable us to typeset the next column using the same approach until we are done with all but the final column.

The approach for the final column is similar only that we do not have to back up over any column gap.

However we do have to move the reference point to its right place: to make the rules appear at the expected places, we should get the typesetting position to the far right again. As we at the moment at the far left we skip to the far right like this:

\begin{verbatim}
\hskip\full\width
\end{verbatim}

Macros to switch between left-right and right-left typesetting. In LR typesetting the \RL@column@boxes is used to combine the columns. When typesetting right to left the \LR@column@boxes is used instead.

The default is left-to-right:

\newcommand\RLmulticolcolumns{
\let\mc@align@columns\RL@column@boxes
}
\newcommand\LRmulticolcolumns{
\let\mc@align@columns\LR@column@boxes
}

The default is left-to-right:

\newcommand\RLmulticolcolumns{
\let\mc@align@columns\RL@column@boxes
}
\newcommand\LRmulticolcolumns{
\let\mc@align@columns\LR@column@boxes
}

The default is left-to-right:

The default is left-to-right:

\newcommand\RLmulticolcolumns{
\let\mc@align@columns\RL@column@boxes
}
\newcommand\LRmulticolcolumns{
\let\mc@align@columns\LR@column@boxes
}

The default is left-to-right:

\newcommand\RLmulticolcolumns{
\let\mc@align@columns\RL@column@boxes
}
\newcommand\LRmulticolcolumns{
\let\mc@align@columns\LR@column@boxes
}

The default is left-to-right:

\newcommand\RLmulticolcolumns{
\let\mc@align@columns\RL@column@boxes
}
\newcommand\LRmulticolcolumns{
\let\mc@align@columns\LR@column@boxes
}

The default is left-to-right:

\newcommand\RLmulticolcolumns{
\let\mc@align@columns\RL@column@boxes
}
\newcommand\LRmulticolcolumns{
\let\mc@align@columns\LR@column@boxes
}

The default is left-to-right:

\newcommand\RLmulticolcolumns{
\let\mc@align@columns\RL@column@boxes
}
\newcommand\LRmulticolcolumns{
\let\mc@align@columns\LR@column@boxes
}

The default is left-to-right:

\newcommand\RLmulticolcolumns{
\let\mc@align@columns\RL@column@boxes
}
\newcommand\LRmulticolcolumns{
\let\mc@align@columns\LR@column@boxes
}

The default is left-to-right:

\newcommand\RLmulticolcolumns{
\let\mc@align@columns\RL@column@boxes
}
\newcommand\LRmulticolcolumns{
\let\mc@align@columns\LR@column@boxes
}

The default is left-to-right:

\newcommand\RLmulticolcolumns{
\let\mc@align@columns\RL@column@boxes
}
\newcommand\LRmulticolcolumns{
\let\mc@align@columns\LR@column@boxes
}

The default is left-to-right:
Then prepare \texttt{\mc@col@type}.

\begin{verbatim}
\edef\mc@col@type{\expandafter\ifx\csname mc@col-\the\mc@col@check@num\endcsname\relax 0\else \csname mc@col-\the\mc@col@check@num\endcsname\fi}\
\end{verbatim}

Finally check for a star, record this information and then call \texttt{\@docolaction} to do the rest.

\begin{verbatim}
\@ifstar{\@docolactionstartrue \@docolaction}{\@docolactionstarfalse\@docolaction}\
\end{verbatim}

\begin{verbatim}
\newcommand\@docolaction[4][1]{\
\edef\@docolactioncheck{\write\@auxout{\string\mc@set@col@status{mc@col-\the\mc@col@check@num}{\mc@col@type}}}\
\if@docolactionstar \@docolactioncheck \fi\
\ifcase \mc@col@type\relax\ifcase #1\or #2\or #3\or #4\fi\or \else \ERRORwrongdefaultgiven \fi\
\if@docolactionstar \@docolactioncheck \else \@docolactioncheck \fi\
}\end{verbatim}

How does the column number get associated with our label? We do this by writing another line into the aux file. Here are the preparations.

\begin{verbatim}
\newcommand\@docolaction[4][1]{\
\edef\@docolactioncheck{\write\@auxout{\string\mc@set@col@status{mc@col-\the\mc@col@check@num}{\mc@col@type}}}}\
\end{verbatim}

Where we do the actual \texttt{\write} depends on the whether or not we gave it a *. If yes, we do it first and then execute the code argument, otherwise we execute that code first and check at the point after that.

\begin{verbatim}
\if@docolactionstar \@docolactioncheck \fi\
\ifcase \mc@col@type\relax\ifcase #1\or #2\or #3\or #4\fi\or \else \ERRORwrongdefaultgiven \fi\
\end{verbatim}

Otherwise we know (or think we know) that this is a first, middle, or last column:

\begin{verbatim}
\if@docolactionstar \@docolactioncheck \else \@docolactioncheck \fi\
\end{verbatim}

Here is the if used above:

\begin{verbatim}
\def\mc@col@status#1{\
\gdef\mc@curr@col@status{#1}}\
\def\mc@set@col@status#1#2{\
\global\expandafter\let\csname #1\endcsname\mc@curr@col@status}\
\end{verbatim}

Because of extra data writing to the aux file the aux file will now contain something like the following after the document is processed the first time:

\begin{verbatim}
\relax\
\mc@col@status{1}\
\mc@set@col@status{lcol-1}{0}\
\mc@col@status{2}\
\mc@set@col@status{lcol-2}{0}\
\mc@col@status{3}\
\mc@set@col@status{lcol-3}{0}\
\mc@col@status{4}\
\mc@set@col@status{lcol-4}{0}\
\end{verbatim}

The \texttt{\mc@col@status} line denotes the column type and has been written out just before corresponding the column box was placed onto the page. The \texttt{\mc@set@col@status} lines have been written out as part of shipping the column boxes out, e.g., \texttt{\mc@set@col@status{1col-1}{0}} was therefore somewhere within the first column as it appears between \texttt{\mc@col@status{1}} and \texttt{\mc@col@status{2}}. The second argument in that line is the value used in the previous run (or zero if there was no previous run). We can use this to determine if a rerun is necessary.

Thus with this knowledge we can set things up to get the labels working.

When the aux file is read in \texttt{\mc@col@status} is used to set \texttt{\mc@curr@col@status}:

\begin{verbatim}
\def\mc@col@status#1{\ifnum #2=\mc@curr@col@status\else\@tempswatrue\fi}\
\AtEndDocument{\def\mc@col@status#1{\ifnum #2=\mc@curr@col@status\else\@tempswafalse\fi}}\
\end{verbatim}

And when \texttt{\mc@set@col@status} is executed we can simply set up the label by associating it with the \texttt{\mc@curr@col@status} and ignore the second argument:

\begin{verbatim}
\def\mc@set@col@status#1#2{|\global\expandafter\let\csname #1\endcsname\mc@curr@col@status}\
\end{verbatim}

The above definition is being used when the \texttt{.aux} file is read in at the beginning. At the end we need a different definition to test if another typesetting run is needed. There we compare the value used in the current run (stored in the second argument) with the value used on the next run. If those two values differ we set \texttt{@tempswa} to false which will trigger the “Label(s) may have changed” warning.

\begin{verbatim}
\def\mc@col@status#1#2{|\ifnum #2=\mc@curr@col@status\else \@tempswafalse\fi}\
\end{verbatim}
Finally, as part of determining in which column we are, we used a switch inside `\mc@col@status@write` to determine if we are in the first column or not.

\newif\ifmc@firstcol
\mc@firstcoltrue
Index

Numbers written in italic refer to the page where the corresponding entry is described; numbers in roman refer to the code lines where the entry is used.

Change History

v1.0c
\enough@room: Penalty 0 added to empty the contribution list. .................. 10

v1.0d
General: All lines shortened to 72 or less. ........ 1

v1.0e
\prepare@multicols: \textwidth changed to \linewidth. .................. 13
Setting of \columnwidth removed. ........ 13
So this file will work with the ‘twocolumn’ command. ........ 13
General: Redefinition of description env. to use \descriptionmargin=5pt in documentation. .................. 1

v1.0f
General: Changed \z@ to 0pt in redefinition of description. .................. 1

v1.1a
\flushcolumns: \flushedcolumns renamed to \flushcolumns. .................. 21
General: \multicol@sep changed to \multicol@sep. .................. 1

v1.2a
\balance@columns: Group around main loop removed. .................. 23
\prepare@multicols: \pretolerance -1 because it nearly never succeeds. ........ 13
\set@floatcmds added. .................. 13
\set@keptmarks added. .................. 13
\set@mult@vsize. 230
\set@emergencystretch added. .................. 13
\vbadness@10001 now. .................. 13
\set@floatcmds: Macro added. .................. 27
\set@emergencystretch: Macro added. .................. 27
\speci@ls: Float boxes freed. .................. 21

35
General: Added mark tracing with \multicols. Minimum of two columns         9
\multicols: Maximum of 5 columns (temp)        9
\multicols: Check closing env.                15
\multicols: Checking for text losses.         12
\multi@column@out: unboxing avoided.          18
\multi@column@out: \null inserted and removed in output           11
\reinsert@footnotes: unboxing avoided.        17
\unbalance: \col@number set to one        16
\balance@columns: Changed to proper
\multi@column@out: \botmark set to
\splitbotmark.                                 19
\prepare@multicols: Checking for text losses. 12
\prepare@multicols: Typeset optional arg inside group 10
\prepare@multicols: Using                        13
\balance@columns: New algorithm for start
\addpenalty \nobreak in \advance left over
from older code                                   25
\balance@columns: \global\advance left over
from column left margin                            25

\endmulticols: Check closing env.              15
\multi@column@out: \botmark set to
\splitbotmark.                                 19
\prepare@multicols: Checking for text losses. 12
\prepare@multicols: Typeset optional arg inside group 10
\prepare@multicols: Using                        13
\balance@columns: Allow columns to come out
a bit long or short                               22
\balance@columns: New box mechanism          31
\balance@columns: New box mechanism          23
\balance@columns: New box mechanism          18
\multicol@leftmargin: use \@totalleftmargin
instead of \@totalleftmargin                    16
\prepare@multicols: saved \@totalleftmargin        11
\balance@columns@out: New box mechanism      16
\prepare@multicols: Add offset to \doublecol@number           11
\balance@columns: New badness mechanism      23
\balance@columns@out: added penalty at
output routine exit                               22
\endmulticols: Again use \penalty                14
\multicols: Penalty moved to later point        10
\multicols: Allow 10 columns again             9
\multicols: Allow columns to come out
a bit long or short                               22
\multicols: New box mechanism                  31
\multicols: New box mechanism                  23
\multicols: New box mechanism                  18
\multicols: Allow 10 columns again             9
\page@sofar: New box mechanism                 16
\prepare@multicols: Add offset to \doublecol@number           11
\balance@columns: New badness mechanism      23
\balance@columns@out: added penalty at
output routine exit                               22
\endmulticols: Again use \penalty                14
\multicols: Penalty moved to later point        10
\multicols: Allow 10 columns again             9
\page@sofar: New box mechanism                 16
\prepare@multicols: Add offset to \doublecol@number           11
\balance@columns: New badness mechanism      23
\balance@columns@out: added penalty at
output routine exit                               22
\endmulticols: Again use \penalty                14
\multicols: Penalty moved to later point        10
\multicols: Allow 10 columns again             9
\page@sofar: New box mechanism                 16
\prepare@multicols: Add offset to \doublecol@number           11
v1.5c
\enough@room: Assign arg to skip register to be able to output value \hspace{2cm} \ldots 11
v1.5g
\set@floatcmds: Updated since floats have changed \hspace{2cm} \ldots 27
v1.5h
\balance@columns: Get kept marks first \hspace{2cm} \ldots 22
\page@sofar: Check for void boxes \hspace{2cm} \ldots 16
v1.5i
\page@sofar: But don’t remove original code. \hspace{2cm} \ldots 16
v1.5j
\set@floatcmds: Updated since floats have changed again \hspace{2cm} \ldots 27
v1.5l
\set@floatcmds: Added \mult@largefloatcheck \hspace{2cm} \ldots 27
General: Try hard to explain unresolved reference that happens if \OnlyDescription is used \hspace{2cm} \ldots 7
v1.5n
General: Applied improvement of documentation, kindly done by Robin Fairbairns. \hspace{2cm} \ldots 1
v1.5o
\footnotetext: Redefinition added pr/2664. \hspace{2cm} \ldots 30
\prepare@multicols: Setting of \columnwidth added again pr/2664. \hspace{2cm} \ldots 13
v1.5p
\multicols: Redefinition of \footnotetext only within env pr/2689. \hspace{2cm} \ldots 9
v1.5q
\balance@columns: Do not reset \mult@firstbox (pr/2739) \hspace{2cm} \ldots 24
\multicols*: Macro added \hspace{2cm} \ldots 26
\endmulticols: Added \hspace{2cm} \ldots 25
\mult@col@col@bre@ak: And removed the group again six years later \hspace{2cm} \ldots 10
\multicols*: Macro added \hspace{2cm} \ldots 30
v1.5r
\footnotetext: Use \footnotetext but with local change to \columnwidth \hspace{2cm} \ldots 30
\multicols@footnotetext: Macro removed again \hspace{2cm} \ldots 30
\multicols: Use \footnotetext but with local change to \columnwidth \hspace{2cm} \ldots 9
v1.5s
\speci@ls: check for \toppenalty pr/2873 \hspace{2cm} \ldots 20
v1.5t
\return@nonemptymark: re-add \mark command which was commented out by mistake at some point in 1998 (pr/2978) \hspace{2cm} \ldots 28
v1.5u
\balance@columns@out: Support \columnbreak \hspace{2cm} \ldots 21
\colbreak@box: Macro added \hspace{2cm} \ldots 31
\columnbreak: Macro added \hspace{2cm} \ldots 31
\multicols@column@out: Support \columnbreak \hspace{2cm} \ldots 18
\speci@ls@column@break \hspace{2cm} \ldots 20
v1.5v
\balance@columns: Added tracing statements for trial unsuccessful \hspace{2cm} \ldots 25
Check last column if it contains forced break and reject trial if that is the case \hspace{2cm} \ldots 25
\balance@columns@out: Added debug statements for column break support \hspace{2cm} \ldots 21
\multicols@column@out: Added debug statements for column break support \hspace{2cm} \ldots 18
\speci@ls: Added debug statements for column break support \hspace{2cm} \ldots 20
v1.5w
\multicols: Make \footnotetext long to allow multi-paragraph footnotes. \hspace{2cm} \ldots 9
v1.5x
\endmulticols: Detect and fix problem if a multicols ends at the top of a page \hspace{2cm} \ldots 15
v1.5y
\balance@columns: Limit column height only in unrestricted mode (pr/3212) \hspace{2cm} \ldots 26
v1.5z
\page@sofar: Ensure that column rule has always \normalcolor \hspace{2cm} \ldots 16
v1.5z1
\c@finalcolumnbadness: Change wrong default for \multicolovershoot to zero (pr/3465). \hspace{2cm} \ldots 29
\mult@col@cols: Add a kern to cancel potential depth of previous line \hspace{2cm} \ldots 10
\page@sofar: Suppress interline glue at this point \hspace{2cm} \ldots 16
v1.6a
\LR@column@boxes: Preparing for adjusting \prevdepth \hspace{2cm} \ldots 31
\mult@col@cols: Adjust spacing \hspace{2cm} \ldots 10
\page@sofar: Preparing for adjusting \prevdepth \hspace{2cm} \ldots 17
General: New option grid \hspace{2cm} \ldots 8
v1.6b
\page@sofar: Different info display \hspace{2cm} \ldots 16
v1.6c
\set@mult@vsize: Collect one line per column more \hspace{2cm} \ldots 14
v1.6d
\endmulticols: Catch problem with \columnbreak in last line \hspace{2cm} \ldots 14
v1.6e
\multicols: Avoid self-referencing definition of \footnotetext (pr/3618) \hspace{2cm} \ldots 9
v1.6f
\balance@columns: \colbreak guard in the wrong position \hspace{2cm} \ldots 25
\columnbreak@rule@color: Make the color of the rule a hook \hspace{2cm} \ldots 17
\page@sofar: Make the color of the rule a hook \hspace{2cm} \ldots 16
v1.6g
\set@floatcmds: Added \minipagefalse \hspace{2cm} \ldots 27
v1.6h
\set@floatcmds: Use \minipagefalse to better support the modifications done by the float package \hspace{2cm} \ldots 27
v1.7a
General: RL language support added ........... 31
v1.7b
\pageasofar: RL language support fixed ........ 17
General: RL language support fixed ............. 31
v1.8a
\balancecolumns: Balancing concept improved 26
\balancecolumns@out: Balancing concept improved .................................. 21
Support for \enlargethispage .................. 22
\maxbalancingoverflow:
\maxbalancingoverflow parameter added 26
\multi@columnout: Only re-add output penalty if it was explicitly set .......... 18
Support for \enlargethispage .................. 18
v1.8b
\balancecolumns: Remove discardable items at the end of split boxes ............ 24
\multi@columnout: And 20odd years later conclude that this was wrong and unboxing
is always needed. ................................. 18
Remove discardable items at the end of split boxes ................................. 18
v1.8c
\endmulticols: Add \color@endgroup to prevent color leak .......................... 14
\multicolors: Add \color@setgroup to prevent color leak ............................. 10
v1.8d
\multi@columnout: Reset \@mparbottom after page finishes ...................... 19
v1.8e
\LR@column@boxes: Support \docolaction ........... 31
\RL@column@boxes: Support \docolaction ........... 32
General: Support \docolaction .................. 9, 32
v1.8f
\endmulticols: Discard spaces before adding \color@endgroup .......................... 14
v1.8g
\pageasofar: Now adjusting \prevdepth 17
Resetting \prevdepth in the right place 17
Warn if value is exceeded not when equal 17
v1.8h
\balancecolumns: All column boxes should obey \maxdepth (pr/4395) 22
Do not report overfull ................................ 23
Use \vfilmaxdepth ................................. 25, 26
\endmulticols: Set \prevdepth for current vlist when returning from multicol
environment ........................................ 15
\endmulticols*: Use \vfilmaxdepth ............... 25
\multi@columnout: Use \vfilmaxdepth .............. 18
\vfilmaxdepth: Macro added (pr/4395) ............ 17
v1.8i
\endmulticols*: Add \null to hide the final fill and only add vertical space if not doing
\raggedcolumns .................................. 30
v1.8j
\balancecolumns: Use \vfil in this case ........ 25
\endmulticols*: Redesign the whole approach 30
\multi@columnout: Set \boxmaxdepth .............. 18

General: The new switch ......................... 29
v1.8l
\balancecolumns: Added additional tracing if column overflows .................. 25
v1.8m
\remove@discardable@items: Another rewrite of \remove@discardable@items hopefully
okay now ........................................ 29
v1.8n
\multi@columnout: Reset \@textfloatsheight after page finishes .......... 19
v1.8o
\c@unbalance: \col@number already initialized in the kernel, so not initializing it in the
package in case the document is in two-column (pr/4435) ......................... 16
\endmulticols*: Ensure we are back in vmode before using \prevdepth (pr/4448) ................ 30
v1.8p
\multi@columnout: Reset \boxmaxdepth .......... 19
v1.8q
\prepare@multicols: Make \clearpage behave like \newpage (pr/4511) .................. 12
v1.8r
\@Mvi: Macro added ............................. 14
\balancecolumns@out: Re-add the final penalty ........................................ 21
\endmulticols: Use special penalty to signal end of environment .................. 15
\speci@ls: Handling end of env through special penalty ......................... 20
v1.8s
\endmulticols: Support for \docolaction
(issue/39) ..................................... 15
v1.8t
\multicols*: Re-add end penalty for \multicols* environment to guard against leftovers (git/53) .......................... 30

v1.8u
\docolaction: Support star with \docolaction 32

v1.8v
\multicolumnout: Removed dead code, the case where this can go wrong is too obscure to worry about it (gh/101) .............. 18

v1.8w
\balancecolumns: Provide minrows counter for balancing ................................. 23
\c@minrows: Provide minrows counter for balancing ................................. 29
